RADIO DIAGRAM MANUALS

☐ New 1956 **VOLUME 16**
Price \$2.50

Repair quickly all new 1956 sets as well as older radios. This big volume contains clearly printed, large schematics, needed alignment data, replacement parts lists, voltage values, and information on stage gain, location of trimmers, and dial stringing, for all important new 1956 sets. Includes material on portables, clock radios, record changers, FM, and auto sets. A worthy companion to fourteen previous volumes used by over 143,000 shrewd radio servicemen. Large size: 8½ x 11 inches. Manual style binding. **\$2.50**
Postpaid, only

RADIO DIAGRAMS FOR PREVIOUS YEARS

Speed up and simplify all radio repairs. Service radios faster, better, easier, save money and time, use these **SUPREME Most-Often-Needed** diagram manuals to get ahead. At the low cost (only \$2 for most volumes) you are assured of having for every job needed diagrams and other essential repair data on 4 out of 5 sets you will ever service. Clearly printed circuits, parts lists, alignment data, and helpful service hints are the facts you need. Average volume has 192 pages, large size 8½ x 11 inches. Manual style binding.

☐ INDEX for all Radio and TV Manuals 25¢

☐ RADIO MATHEMATICS

Explains arithmetic and simple algebra in connection with units, color code, meter scales, Ohm's law, alternating currents, ohmmeter testing, wattage rating, series and parallel connections, capacity, inductance, mixed circuits, vacuum tubes, curves, the decibel, etc., and has numerous examples. Only **25¢**

☐ How to Modernize Radios

Cash in by improving and modernizing all out of date radio sets and cabinets. Practical job-sheets with schematics and photographs make this work easy. Size 8½ x 11 inches. Your price only **\$1**

☐ ARVIN DIAGRAM Manual (Pre-War Radios) 50¢

☐ RADIO SERVICING COURSE

Here is your practical radio course of 22 easy-to-follow lessons. Review fundamentals, learn new servicing tricks. Just like a \$200.00 correspondence course. Everything in radio servicing. With self-testing questions. New edition. Price only **\$2.50**

SUPREME TELEVISION MANUALS

☐ 1957 TV Manual, TV-12

This new giant volume of 1957 television factory data will give you everything you need to repair and adjust all present-day TV sets. The **television series** manuals are amazing bargains and defy competition. The 1957 volume contains circuit explanations, 192 pages of alignment facts, test patterns, response curves, waveforms, voltage charts, hints, and dozens of mammoth double-page work-bench diagrams. Large size 8½ x 11 inches. Sturdy covers. Book binding opens flat. Amazing value. Price postpaid, only.... **\$3**

EARLIER TV MANUALS FOR 1956 TO 1948

Supreme TV manuals cover all needed service material on every popular TV set of every important manufacturer. Here is helpful, practical, factory-prepared data that will really make TV servicing and adjustment easy for you. **Supreme** giant TV manuals have complete circuits, alignment facts, test patterns, response curves, service hints, recommended changes, voltage charts, waveforms, and many double-page diagram blueprints. Here is your TV service material to help you do more expert work quicker; and priced at only \$3. The **UHF Converters** manual at only \$1.50 has everything you need on UHF. **Radio** manuals described at left.

☐ TELEVISION SERVICING COURSE

Let this new course teach you TV servicing. Amazing bargain, complete only \$3, full price for all lessons. Giant in size, mammoth in scope, topics just like a \$200.00 correspondence course. Lessons on picture faults, circuits, adjustments, short-cuts, UHF, alignment hints, antenna problems, trouble-shooting, test equipment, picture analysis. Special, only **\$3**

☐ Practical Radio & Electronics Course

Here is your complete home study course of 53 lessons designed to train any beginner to be an expert in radio and electronics. Covers every topic of radio, electronics, with lessons on test equipment, FM, TV, radio, etc. Giant 8½ x 11 inches, 3-in-1 volume, includes all lessons, instructor's notes, test questions. New edition. Only..... **\$3.95**

☐ ANSWER BOOK to the above course..... 25¢

☐ Simplified Radio Servicing by COMPARISON Method

Revolutionary different **COMPARISON** technique permits you to do expert work on all radio sets. Most repairs can be made without test equipment or with only a volt-ohmmeter. Many simple, point-to-point, cross-reference, circuit suggestions locate the faults instantly. Plan copyrighted. Covers every radio set — new and old models. This new servicing technique presented in handy manual form, size 8½ x 11 inches, 92 pages. Over 1,000 practical service hints. 26 large, trouble-shooting blueprints. Charts for circuit analysis. 114 tests using a 5c resistor. Developed by M. N. Beitman. New edition. Price only..... **\$1.50**

[illegible]

REMOVING THE CHASSIS

The chassis need be removed from the cabinet top section only when servicing the printed wiring side.

••

- (a) Remove On-Off-Volume and Tuning knobs.
- (b) Remove screws mounting cabinet cover to chassis (2 on each side).

(c) Free cabinet cover from chassis by lifting cover up. Be careful not to cause any undue strain on leads going from "pop-up" antenna in cabinet cover to chassis.

To service the component side of the chassis, remove the bottom section of the cabinet by rotating the plastic knob at the bottom of the cabinet one-third of a turn to the left; then slide off bottom section of cabinet.

To service the chassis in operation with bottom section of cabinet removed, the **INTERLOCK SWITCH** must be in a closed position.

VOLTAGE DATA

Voltages shown on schematic diagram.

- All voltages taken between the tube socket terminals and B minus (pin 7 of 1U5 tube).
- Dial set at low frequency end; volume control at minimum.
- Voltages measured on 117 volts AC with vacuum-tube voltmeter.

SCHEMATIC NOTES

A . . . indicates alignment points. All capacitor values shown in microfarads unless otherwise specified. Fixed resistor values shown in ohms.

REMOVE FOIL & CONNECT C10
BETWEEN POINTS A AND B

REMOVE CIO FROM THESE TWO POINTS & PUT A JUMPER IN ITS PLACE.

HUM: If excessive hum is encountered, check the location of audio coupling capacitor, C10, in the control grid circuit of the 1U5. See

View of Wiring Side of Printed Board.

CHASSIS 4E2 and 4H2
MODELS 4E21 • 4F22 • 4F24 • 4F26 • 4F28
4H22 • 4H24 • 4H26 • 4H28

(Continued from page 4, adjacent at left)

ALIGNMENT PROCEDURE

- Battery power is preferable for alignment; use FRESH batteries. If this set is to be aligned while operating on an AC power line, an isolation transformer should be used. If an isolation transformer is not available, connect a .1 mfd. capacitor in series with the signal generator low side to B minus (pin 7 of 1U5 tube).
- The case top cover must be removed to align IF (step 1).
- Set Volume control to maximum.
- Connect output meter across speaker voice coil.
- Use lowest setting of signal generator capable of producing adequate indication on lowest scale of output meter.
- Use a non-metallic alignment tool for IF transformers.
- Repeat adjustments to insure good results.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Adjustment Description	Adjustment Designation	Type of Adjustment
1	.1 mfd. capacitor	Stator of antenna tuning capacitor	455 KC	Gang fully open	2nd IF 1st IF	A, B* C, D*	Maximum output
Install the case top section removed during IF Alignment							
2	Loop of several turns of wire, or place generator lead close to receiver for adequate signal pickup.	No actual connection (signal by radiation)	1620 KC	Gang fully open	Oscillator (on gang)	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver for adequate signal pickup.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna (on gang)	F	Maximum output

*Adjustments B and D are made from underside of chassis. See figure 1. To avoid splitting the slotted head of powdered iron tuning slug in IF transformers, use an alignment tool with a blade 3/32" wide.

SERVICING THE SET

Servicing "printed" circuit sets is, in general, much the same as servicing ordinary receivers. However, certain tools and techniques are well suited for this type of work. The following items are especially useful:

1. Good pair of long-nose pliers.
2. Sharp wire cutters.
3. Small stiff glue brush (for solder removal).
4. Pencil type soldering iron with a small tip (35 watts or less).

WARNING: Excessive heat may damage the "printed" circuit during component replacement if a soldering pencil, iron or gun of higher wattage rating is used.

5. 60-40 low temperature rosin core solder (should be used for all soldering).
6. Tinned jumper wires.
7. Metal pick (soldering aid).

Figure 1. Tube and Adjustment Location.

COMPONENT REPLACEMENT

All components used in this receiver are of standard size and design and are mounted on the top side of the chassis.

Resistors and capacitors should be replaced by clipping out the defective part and neatly soldering the new part to the connecting leads remaining from the original part.

If a unit, such as the oscillator coil or IF transformer is to be removed, heat the mounting lugs with a pencil type soldering iron and straighten them with a long nose pliers or metal pick. Continue heating the lugs and brush away the molten solder with a small stiff glue brush. Remove the defective unit by lifting it off the chassis. Before inserting the new unit, be certain that the lug holes are open and free from solder. Forcing a lug against a solder filled lug hole may break the bond between the chassis base and the "printed" wiring.

An open or damaged section of "printed" circuit wiring can be replaced by soldering a short jumper wire across the points to be connected.

To avoid need for complete tube socket replacement, defective tube socket pin clips may be replaced individually. Tube socket pin clips are available under part number 87A35-2.

Note: If sockets must be replaced, the tubular shield (center connection) at the bottom of each tube socket must be securely soldered to the "printed" circuit wiring, otherwise hum or oscillation will result.

H53377	Blond	4N2

TUBE LOCATIONS

output plug (M9) from the chassis. Remove the Volume, Bass and Treble control knobs. Remove the four screws that mount the chassis and carefully lift the chassis.

To Remove the Record Changer:

Disconnect the audio input plug (M1) and the record changer motor plug (M5) from the chassis. Remove the washer-head screws that mount the record changer while holding the record changer in place. Remove the record changer by lifting it free from the cabinet.

TO REMOVE THE CHASSIS

After removing the line cord plug from the wall outlet, clamp the TONE ARM to the tone arm rest. Carefully turn the phono-graph upside down on a soft, padded surface. Remove the cabinet bottom mounting screws and lift the cabinet bottom and legs off the cabinet.

Disconnect the audio input plug (M1), the record changer motor plug (M5) and the audio

TUBE LOCATIONS

50L6GT

1/2 12AX7

1/2 12AX7

1/2 12AX7

To Remove the Record Changer: Follow the procedure outlined under "TO REPLACE TUBES", and then proceed as follows:

Disconnect the audio input plug (M3) and the record changer motor plug (M6) from the chassis. Remove the three washer-head screws that mount the record changer while holding the record changer in place. Then remove the record changer by lifting it free from the cabinet.

Service Note: The "Rej-On-Off" switch (S1) on the record changer operates both amplifier and record changer motor. To operate the amplifier and measure voltages with the record changer disconnected, a short, temporary jumper wire must be connected between the brown and orange leads on socket "M7". See schematic.

Amplifier voltage readings may also be taken by connecting the record changer motor plug (M6) to the socket (M7) on the chassis. Unclamp the tone arm from the tone arm rest and move the "Rej-On-Off" switch to the "On" position.

TO REPLACE TUBES

Remove the line cord plug from the wall outlet. To make tubes accessible for replacement, the cabinet back must be taken off by removing the cabinet back mounting screws.

Caution: The amplifier must be disconnected from the power source before attempting to remove tubes V1 (12AX7) and V2 (12AX7). Failure to observe this precaution will burn out resistors R34 and hum-bucking control R36; see schematic.

To Remove the Chassis: Follow the procedure outlined above under "TO REPLACE TUBES", and then proceed as follows:

Disconnect the audio input plug (M3), the record changer motor plug (M6) and the audio output plug (M9) from the chassis. Remove the four knobs from the controls on the chassis. Remove the four screws that mount the chassis and carefully lift the chassis from the cabinet.

Admiral

7L1 Chassis

MODELS 7L12 • 7L14 • 7L16 • 7L18

(Alignment is on page 10, over)

BATTERY REPLACEMENT:

To install replacement batteries, remove the bottom section of the cabinet by rotating the plastic knob at the bottom of the cabinet one-third of a turn to the left. This frees the bottom section of the cabinet from the chassis, and the bottom section may be removed by pulling it away (down) from the top section.

To remove worn out batteries, first remove the wing screw at the right of the battery compartment. Move the "L-shaped" battery contact bracket aside, being careful not to exert any undue strain on its connecting wires. Then slide the batteries out.

When installing new batteries, be sure that the positive terminal of each battery faces in the direction indicated by the arrows stamped in the battery compartment. The batteries rest in the battery compartment in two rows. The bottom row have their positive terminal facing toward the gang, the top row have their positive terminal facing toward the Off-On-Volume control. Six batteries connected in series provide 9 volts of power to operate the set.

In normal use, batteries for this set should furnish about 700 operating hours.

REMOVING THE CHASSIS

To remove the chassis from the cabinet top section, proceed as follows:

1. Remove Off-On-Volume and Tuning control knobs.
2. Remove 4 screws mounting cabinet top section to chassis (2 on each side of cabinet top section).
3. Remove Sun Power Pak receptacle at rear of cabinet top section by removing hex nut and washer fastening receptacle to cabinet. Then carefully push receptacle free of its mounting hole.
4. Carefully lift cabinet top section up and toward the rear of the cabinet. Be careful not to exert any undue strain on connecting leads.

To service the component side of the printed wiring board, it will be necessary to remove the bottom section of the cabinet. Follow procedure outlined under "Battery Replacement".

TESTING TRANSISTORS

The transistors used in this set are junction type. This type of transistor is more apt to become shorted than open. A shorted transistor will cause a resultant increase in current drain of the power supply. Thus a quick check is to measure the current drain with a milliammeter connected in series with the leads from the power supply. Normal current drain with no signal will be approximately 8 milliamperes. Transistors often become shorted because of excessive current flow, usually indicative of circuit trouble. If a transistor is found to be shorted, check the circuit carefully before installing a new one.

Admiral

CHASSIS 7L1
MODELS 7L12 • 7L14 • 7L16 • 7L18

ALIGNMENT PROCEDURE

- Fresh batteries should be used when making an alignment.
- Set Volume control full on.
- Connect output meter across speaker voice coil.
- Use lowest setting of signal generator capable of producing adequate indication on lowest scale of output meter (maintain setting of .3 volt (25 mw) or less).
- Use a non-metallic alignment tool for IF transformers.
- Repeat adjustments to insure good results.
- Radio should be aligned while chassis is in cabinet top section.
- Antenna in "pop-up" position and rotated 90° (perpendicular to cabinet front).

Step	Connection of Signal Generator	Signal Generator Frequency	Receiver Gang Setting	Adjustment Description	Adjustment
Disconnect 455 KC trap, or short capacitor C3 with clip lead.					
1	Radiated Signal Loop of several turns of wire, or place generator lead close to receiver for adequate signal pickup.	455 KC	Gang fully open	3rd IF 2nd IF 1st IF	"A, B, C, D, and E" for maximum output

Repeat Step 1 several times until there is no further increase in the output. Reconnect 455 KC Trap.

2	Same as "STEP 1".	455 KC	Gang fully open	455 KC Trap	"J" for minimum output
3	Same as "STEP 1".	1620 KC	Gang fully open	Oscillator Trimmer	"F" for maximum output
4	Same as "STEP 1".	1400 KC	Tune in generator signal	Antenna Trimmer *(Rock Gang)	"G" for maximum output

NOTE: DO NOT perform the following steps unless you are unable to tune in 535 KC.
BEFORE PROCEEDING, SET OSCILLATOR TRIMMER ¼ TURN FROM ITS TIGHT POSITION.

5	Same as "STEP 1".	535 KC	Gang fully open	Oscillator Core	"H" for maximum output
6	Same as "STEP 1".	1620 KC	Gang fully open	Oscillator Trimmer	"F" for maximum output
7	Repeat Steps 5 and 6 until oscillator covers required range; Step 6 should be last adjustment.				
8	Same as "STEP 1".	1400 KC	Tune for maximum	Antenna Trimmer	"G" for maximum output

To avoid splitting the slotted head of powdered iron tuning slug in IF transformers, use an alignment tool with a blade 3/32" wide.

*Antenna trimmer "C" should first be adjusted for maximum output. Then try to increase output further by rotating gang slightly; alternately in each direction (rocking), and readjusting trimmer "C" for maximum output.

(See page 9, preceding, for circuit diagram and other data)

ALIGNMENT PROCEDURE

1. Remove chassis from the cabinet.
2. Connect an output meter across the speaker voice coil (3.2 ohms) terminals.
3. Feed an R-F signal modulated 30% at 400 cycles to the receiver, as indicated in the alignment chart. Connect signal generator through dummy antenna to mixer grid when aligning I-F transformers, and radiate signal to loop antenna when making the oscillator and antenna trimmer adjustment.
4. Turn the Volume Control to maximum clockwise position and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action.

ALIGNMENT CHART

Alignment	Signal Generator Output			Position of Tuning Gang	Adjust for Max. Output	Remarks
	Freq. in KC.	In Series With	TO			
1	455	Dummy Antenna	Mixer grid pin 7 of V1	Open	A & B	
2	455	Dummy Antenna	Mixer grid pin 7 of V1	Open	C & D	
3 Repeat steps 1 and 2 until maximum output is obtained.						See note 1
4	1620	Radiated Sig.	Antenna	Open	E	See note 2 & 3
5	1400	Radiated Sig.	Antenna	Tune in Signal	F	See note 2 & 3

1. Remove dummy antenna and reconnect loop antenna (yellow wire to inside of loop winding).
2. Loop antenna should be positioned with respect to cabinet and chassis so that no further adjustment is required when chassis is placed in the cabinet.
3. The signal can be radiated to the antenna by placing the output lead of the signal generator close to the loop antenna.

RESISTANCE READINGS FOR CHASSIS 120309 120328

SYMBOL	TERMINAL B	TERMINAL C	TERMINAL E
Q1	165KΩ	3.3K*Ω	1500Ω
Q2	4KΩ	3800*Ω	330Ω
Q3	2KΩ	3.3K*Ω	1000Ω
Q4	4.2KΩ	500Ω	3.4KΩ
Q5	3K*Ω	22Ω	2.9K*Ω
Q6	3K*Ω	18	2.9*Ω

CONDITIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltages indicated are positive d.c., resistance is ohms.
2. Measurements made with volt-ohm-mill or equivalent.
3. All measurements taken between points and chassis, unless otherwise indicated.
4. Before taking resistance measurements, turn on-off switch to the "off" position (or disconnect batteries). Then remove transistors.
5. Volume control at maximum, no signal applied for voltage measurements.
6. Nominal tolerance in component values makes possible a variation of $\pm 15\%$ in readings.
7. K is Kilohms, MEG is megohms.

ALIGNMENT INSTRUCTIONS

Volume control should be at maximum; output of signal generator should be no higher than necessary to obtain on output reading with a 30% audio modulated R.F. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to junction of L-1 & C-2. Low side to chassis.	455 KC.	Tuning condenser fully open.	Across voice coil.	T2, T3 and T1	Adjust for maximum output starting with T3.
2		Use a loop set perpendicular and about 20" from center of bar loop ant. in set.	1650 KC.	Tuning condenser fully open.	Across voice coil.	C-3A (osc. trimmer) See note below	Fashion loop of several turns of wire and radiate signal into bar loop of receiver. Adjust for maximum output.
3		"	1400 KC.	Tune for maximum output.	Across voice coil.	C-2A (Ant. trimmer)	Adjust for maximum output.
4		"	600 KC.	Tuning condenser set for 600 KC.	Across voice coil.	Osc. slug in L-2	Rock the variable cond. each side of 600 KC while adj. osc. slug for maximum response.
5		"	1650 KC.	Tuning condenser fully open.	"	C-3A Osc. trimmer	If readjustment is necessary repeat steps 2 to 4 until no further improvement is noted.

NOTE: C-3A is the oscillator trimmer capacitor, physically located on the bottom side of the tuning capacitor when the chassis is mounted in its case. Both C-3A and C-2A can be reached (see Fig. 1.) C-3B is the alternate oscillator trimmer capacitor and is factory adjusted for minimum trimmer capacity requirements.

3		"	1400 KC	Tune for maximum output.	Across voice coil.	Trimmer C-1A (Ant.)	Adjust for maximum output.

SERVICING MODULIZED RADIO CHASSIS

1. General Information

The same care should be exercised in repairing a modulized etched wiring radio chassis as is used in regular etched circuit board repair (low wattage iron, stiff brush, etc.). Past experience has indicated that the majority of radio failures are due to tubes and components which are not included within a module (electrolytic, oscillator coil, volume control, etc.), therefore, the type of service required on modulized chassis will generally be the same as for conventional chassis.

Since most of the R & C components in the R.F. and I.F. sections are in one module and the audio R & C components in the other, it would only be necessary to isolate the trouble to one of the modules rather than to a specific component. This should reduce troubleshooting time on the more difficult repair jobs, especially those which are of an intermittent nature.

If a particular trouble could be isolated to a defective component as easily as to a defective module, or if a replacement module were not immediately available, it would be desirable to repair rather than replace the module. Information on the replacement and repair of a module is given below.

2. Replacement of a Module

a-Remove defective module by dipping underside (dip soldered side) in a small solder pot (which is now commercially available) or apply a solder iron or gun with a square shaped tip to all of the risers at the same time.

b-While the heat is being applied to all of the risers at the same time by one of the above methods, pull the defective module away from the etched circuit board. (Note the location of the module positioning notch with respect to the etched board).

c-Place a new module in the etched board making certain to position it as the original and individually solder each riser in place or dip in a solder pot.

Note: To reduce the possibility of interchanging modules during repair or orientating the module incorrectly, several unused riser wires are clipped below deck "A" as can be noted on the module schematic. The combination of clipped riser wires are different between the two modules. Since there are no holes in the etched circuit board to correspond to these clipped risers an exact replacement module can only be inserted the correct way.

3. Repair of Modules

The module diagrams shown on the schematic provide enough information to determine whether or not it would be practical to repair the module for a particular defect and if so how to proceed. These diagrams not only show the necessary to which a component is connected, but also to which deck (A, B, C) it is physically mounted. This type of information is necessary to properly isolate a defective module component by cutting a riser wire and to show what other components are removed from the circuit at the same time. If it is practical to repair the module, then all modular components removed from the circuit (connected above the point where the riser is cut) must be replaced by conventional components soldered directly to the dip soldered side of the etched circuit board.

a-Determine defective component by general troubleshooting procedures.

b-Refer to proper module diagram on schematic and decide whether or not this component could be isolated (by cutting riser wire or wires) without disconnecting too many other components from the circuit.

c-If repair is practical, cut required riser wire or wires and connect replacement component or components to dip-soldered side of etched board (across proper riser wires) rather than to module itself.

Note: A diagonal cutters should never be used to cut a riser wire between decks since permanent damage could result. The pinching action of a diagonal cutter could crack one or more of the module decks. A very fine toothed saw blade or a small hand powered tool with a 1/32" abrasive disk should be used for this purpose.

TO REPLACE STYLUS AND SELECTOR BAR

For best operation and record tracking, it is recommended that the stylus (needle) and selector bar (flip-over arm) be replaced as a single unit rather than the stylus itself. To change this unit, proceed as follows:

1. Lift up tone arm.
2. With one hand, hold spring clip in a direction away from tone arm.
3. With other hand, slide out selector bar and stylus as shown in diagram.
4. To replace new stylus and selector bar, reverse above procedure.

THE FIRESTONE TIRE & RUBBER CO.

Stock No. 4-B-82
Code No. 120-6-MP69
(6 Volt)

Stock No. 4-B-83
Code No. 120-6-MP126
(12 Volt)

This is an exact schematic for the 12-volt model. The 6-volt model is identical except that the tubes are of the corresponding 6-volt series.

ALIGNMENT PROCEDURE

Connect dummy antenna in series with output lead of signal generator.

Connect ground lead of generator to chassis. All adjustments maximum.

For alignment input points refer to schematic diagram.

1. Set receiver dial at extreme high end (1610 KC).
Adjust T2 top and bottom at 265 KC.
Adjust T1 top and bottom at 265 KC.
Adjust CT-3 for 1610 KC.
2. Tune in 1400 KC signal from generator.
Adjust CT-1 and CT-2 (68 MMFD dummy).
3. After installing radio in car, re-trim CT-1 on weak station near 1400 KC with antenna fully extended.

PUSH-BUTTON OPERATION

To set any push-button, pull the button straight out, select the desired station with the STATION SELECTOR KNOB and press in the push-button. Any push-button may be re-set at any time without disturbing the setting of the other buttons.

Tube and Trimmer Locations

STOCK NO. 4-C-29

CODE NO. 120-6-TT600

FIG. 1

FIG. 2

FIG. 3

TO REPLACE TUBES OR SERVICE

The chassis should be removed in the following manner:

1. Turn off receiver. Close the variable gang condenser by setting the tuning knob to 5.5 on the dial scale.
2. Remove the back cover and batteries.
3. Remove the speaker securing bracket by removing the two round-head screws from the "A" battery side of the receiver.
4. Remove the tuning knob by pulling the knob straight off the tuning shaft.
5. Remove the three flat head mounting screws underneath the tuning knob.
6. When replacing tubes be sure red dot on tube base is positioned to match dot of tube location chart, Fig. 2.

ALIGNMENT PROCEDURE

Volume control — Maximum, all adjustments.

No signal applied to antenna.

Connect dummy antenna in series with output lead of signal generator.

Connect ground lead of signal generator to chassis.

Dial Setting	Generator Frequency	Dummy Ant.	Generator Connection	Trimmer Adjustment	Trimmer Function
1. Fully open	455 KC	.1 MFD	1AH4 Grid	Maximum	Output I.F. Top & Bottom
2. Fully open	455 KC	.1 MFD	1V6 Grid	Maximum	Input I.F. Top & Bottom
3. Fully open	1610 KC	.1 MFD	1V6 Grid	Maximum	Oscillator Trimmer
4. Tune in signal from generator	1400 KC		Loosely couple signal generator to "Magna Loop"	Maximum	Antenna Trimmer

Repeat alignment procedure as a final check.

ELECTRICAL SPECIFICATIONS

Power Supply	105-120 Volts AC-DC
Frequency Range	540-1650 KC
Intermediate Frequency	456 KC
Sensitivity	60 microvolts on loop for 50 MW output
Selectivity	8 KC 2X - 20 KC 10X at 456 KC
Tuning	2 Gang Capacitor
Power Consumption	30 Watts
Power Output	1.9 Watt, undistorted

GENERAL ELECTRIC

Model 850

TO REPLACE A TUBE SOCKET

Cut the socket free by cutting all of the socket terminals at the chassis and unsolder the center terminal. Now, heat each terminal only enough to push it out. The new socket can now be inserted into the holes left by the old one and soldered into place.

TO REPLACE THE VOLUME CONTROL

Remove the shaft nut, then cut the center and lower terminals. Apply only enough heat to the upper terminal to pull out the control. Apply heat to the center and lower terminals so they may be pushed out. The new control may now be inserted into place and soldered.

TO REMOVE CHASSIS FROM CABINET

Remove cabinet back and interlock. Remove the four self-tapping screws (hex heads), one on each corner of the chassis, and the single hex screw just below the tuning gang capacitor. Pull off the volume control knob. The tuning control knob is captivated to the cabinet, so the chassis must be pulled out of the cabinet, at the same time pulling it off the tuning knob, which remains on the cabinet. When pulling out the chassis, it is best to grasp the tuning capacitor (C1) by the thumb and forefinger of one hand and the tuning knob by the other hand and pull.

CAUTION: It is important to use extreme care while replacing parts and/or soldering on this chassis. Too much heat on the chassis will cause the copper plating to become unbonded. Only apply the soldering iron long enough to melt the solder and pull out the part to be replaced.

NOTE: The shield can on T1 may be removed by unfastening the two spring clips and lifting the can off the transformer, thereby leaving the coils open for inspection or repair.

the hallicrafters TR-88 TRANSISTOR RADIO

(Continued on the next page)

(Alignment on the next page, over)

OSCILLATOR COUPLING

The oscillator injection voltage is variable by changing the coupling between the windings of the oscillator coil. The injection voltage should be checked:

1. Whenever the MIXER/OSC transistor, Q₁ is replaced.
2. If the receiver will not operate properly when the battery supply voltage drops to approximately 4 volts.
3. If the receiver is lacking in sensitivity at the low frequency end of the dial or has "squaging" near the high end of the dial.

ADJUSTMENT

The coupling between windings of the oscillator coil has been factory set to provide an oscillator injection voltage (as measured across R₂ with a sensitive R-F voltmeter) of 60 millivolts. The injection voltage is set with the tuning gang closed, and a battery supply voltage of a full 6 volts. With the tuning gang open the reading should not exceed 150 millivolts.

If careful measurement reveals that the injection voltage is not within the approximate factory set range it may be corrected simply by loosening the wax seal on the coupling winding and moving it a short distance as required. Be sure to reseat the winding in position when the adjustment has been completed.

CAUTION: Always consult figure when installing the batteries and be sure that they are placed in the clips exactly as shown. Incorrect placement of the batteries will make the receiver inoperative and will cause damage to some of its parts.

the **hallicrafters** co.**TR-88 TRANSISTOR RADIO**

(Continued from the preceding page)

IF ALIGNMENT

STEP	SIGNAL GENERATOR CONNECTIONS	GENERATOR FREQUENCY	RECEIVER DIAL SETTING	ADJUST	REMARKS
1	Across secondary of stick-loop ant. (terminal strip on top side of chassis).	455 KC modulated	Tuning gang open.	A, B & C i-f slugs	Tune for maximum output.
2	Same as step 1.	Same as step 1	Slowly tune over entire range.	E & D Neutralizing adj.	Adjust so that no oscillation occurs throughout the tuning range.

I-F oscillation will appear in the output, as heard in the speaker, as distortion that may range from "motor boating" to howl. Some compromise adjustment of the i-f slugs A, B & C, may be required to permit neutralization over the entire tuning range.

RF ALIGNMENT

3	Loosely couple to stick-loop antenna.	1620 KC modulated	Tuning gang open.	G, Osc. trimmer	Tune for maximum output.
4	Same as step 3.	535 KC modulated	Tuning gang closed.	F, Osc. Coil slug	Same as step 3.
5	Same as step 3.	1400 KC modulated	1400 KC	H, Ant. trimmer	Same as step 3.

VOLTAGE TABLE (BOTTOM VIEW OF CHASSIS)

MAGNAVOX Type AM2 Radio

ALIGNMENT PROCEDURE

When aligning IF slugs, use a properly shaped, non-metallic tool to avoid stripping the slot in the iron core. The $1\frac{1}{2}$ volt battery should be connected with clip leads to permit easy entry into bottom holes of IF cans.

Always have both batteries in their proper positions when aligning the R.F. section, oscillator, and antenna trimmers. To compensate for front cabinet trim, be sure to have a piece of metal or foil in some position as trim, with respect to chassis during R.F., oscillator, and antenna alignment. Mistracking will result if this is not observed.

TO ALIGN 1640 KC OSCILLATOR AND 1400 KC ANTENNA TRIMMERS: Couple test oscillator to receiver by; (1) make loop consisting of five turns of No. 20 to 30 size wire, wound on a 2" or 3" form. (2) connect this loop across output of test oscillator. (3) place test oscillator loop near radio antenna—but no closer than 6" to radio antenna. BE SURE THAT NEITHER LOOP NOR RADIO MOVES WHILE ALIGNMENT IS BEING MADE.

STEPS	SET RECEIVER DIAL TO	TEST OSCILLATOR		REFER TO SCHEMATIC AND LAYOUT FOR LOCATION OF ADJUSTMENTS
		FREQ.	CONNECT OUTPUT	
1	Any point where no interfering signal is received.	455 KC	High side to pin 6 (grid) of 1R5. Low side through a 0.02 MFD condenser to chassis.	Adjust A6, A5, A4, A3 in that order (IF slugs) for maximum output at speaker. Recheck settings after all are completed.
2	Max. clockwise	1640 KC	Test loop (see procedure above)	Adjust A2, (osc. trimmer on gang condenser)
3	1400 KC	1400 KC	Test loop (see procedure above)	Adjust A1, (Antenna trimmer on gang condenser)

chassis plus clock and appliance outlet.

ALIGNMENT

Use an isolation transformer between the power line and the receiver. If not available, connect low side of generator to B- through a .1 mf capacitor. Connect a low range output meter across speaker voice coil and set volume control to maximum. Attenuate generator output to maintain .4 volts on output meter to prevent overloading.

STEP	GENERATOR CONNECTION	GENERATOR FREQUENCY (400 cycle mod)	GANG SETTING	ADJUST	REMARKS
IF ALIGNMENT 1.	Grid of conv (pin 7, 12BE6) thru .1 mf & B-	455 Kc	Fully open	T1 and T2 Top and Bottom	Adjust for maximum.
RF ALIGNMENT 2.	Grid of conv (pin 7, 12BE6) thru .1 mf & B-	1620 Kc	Fully open	C1, OSC. TRIMMER	Adjust for maximum.

CIRCUIT DESCRIPTION

1. The circuit of this chassis is conventional - there are no built-in resistors or capacitors. Leads are plated on both sides of the chassis base, thereby replacing the usual connecting wires and making wiring more uniform.
2. The metal plating extends through all the holes on the chassis, connecting circuits on the front with those on the rear.
3. Reference to the schematic diagram and to chassis will permit the circuit to be traced easily.

Capacitors - Decimal values in MF, all others in MMF unless otherwise specified.

To Remove Record Changer from Mounting Board

1. Turn the record changer mounting screws down flush with the record changer base.
2. From bottom of changer, turn the Timmermann nuts located at the ends of the mounting screws so they are parallel with the screws.
3. Lift record changer off of the mounting board.

To Remove Chassis from Cabinet

1. Remove the four screws which hold the perforated panel in place and remove the panel.
2. Remove the four screws which hold the changer mounting board in place and remove changer board (disconnect all leads from changer).
3. Pull knobs off from front of cabinet.
4. Remove nuts which mount chassis to cabinet and disconnect speaker leads.
5. Remove chassis from cabinet.

67HFK4 American Walnut
67HFP1 Maroon & Tan
67HFT1 California Mahogany

CHASSIS
HS-544

To Remove Chassis from Cabinet

(67HFk series)

1. Remove VOICE-MUSIC switch from cabinet.
2. Pull off three control knobs.
3. Remove cabinet back cover.
4. Disconnect leads from changer and speakers.
5. Remove two screws that mount chassis to cabinet, slide chassis from cabinet.

(67HFP series)

1. Pull off the three control knobs.
2. Remove wingnut from cabinet back cover and remove cover.
3. Remove screws from bottom panel (located at base of cabinet) and remove panel from cabinet.
4. Disconnect leads from changer and speakers.
5. Remove nuts from block of wood adjacent to chassis and lift block of wood out of way.
6. Remove chassis mounting screw and slide chassis out from bottom of cabinet.

(67HF T series)

1. Pull off the three control knobs.
2. Remove cabinet back cover.
3. Disconnect leads from changer and speakers.
4. From rear of cabinet, remove two chassis mounting screws from cabinet and slide chassis out of cabinet.

PARTS LOCATIONS

Automotive superheterodyne receiver designed for custom installation in the 1956 Buick.

VOLTAGES - measured from point indicated to chassis with a VTVM. No signal input.
INPUT VOLTAGE 14 VDC. $\pm 10\%$

CAPACITORS - decimal values in mf, all others in mmf unless otherwise specified.

C5A, B, C, D, E CONNECTIONS

CONNECT TO
RADIOD TERM
OF FUSE BLOCK.

MOTOROLA

**MODEL
BKA6T**

1. **RADIO POLARITY** - When servicing this radio on the service bench, be sure that the radio housing is connected to the negative side of the power source and that the "A" lead connects to the positive side.

2. **TRANSISTOR REPLACEMENT** - When replacing a transistor, be sure that the transistor contacts are connected as follows: the lead from the driver transformer T-3 to the base terminal; the lead from the output transformer T-4 to the emitter terminal; the collector is automatically grounded when the transistor is mounted to the heat radiator. The schematic diagram shows the position of the transistor electrodes as viewed from the terminal side. Care should be taken when mounting the transistor to the heat radiator; if not securely mounted, the transistor may be damaged from lack of proper heat dissipation. **NOTE:** When a transistor is replaced, the emitter current should be checked. (See **EMITTER CURRENT ADJUSTMENT**).

3. **EMITTER CURRENT ADJUSTMENT** - To adjust the emitter current, insert a milliammeter in series with the emitter electrode. This can be done by unplugging emitter lead and connecting positive side of milliammeter to lead, and negative side to transistor emitter terminal. Adjust the variable 500 ohm resistor R-23 for 480 ma emitter current. **Note:** This milliammeter should be a quality instrument with low internal resistance of .1 ohm max.

STEP	GENERATOR CONNECTION	GENERATOR FREQUENCY (400 cycle mod)	TUNER SET TO	ADJUST	REMARKS
1.	IF ALIGNMENT Conv grid (pin 7) .1 mf & thru chassis	455 Kc	Hi end stop	1, 2, 3 & 4	Peak for maximum.
2.	RF ALIGNMENT Ant recept through dummy (see Fig.)	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
3.	Ant recept through dummy (see Fig.)	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
4.	"	1200 Kc	Tuner carriage 9/32" from hi end stop	8, 9 & 10	Peak for maximum using alignment tool Motorola Part No. 66A76278.
5.	"	1610 Kc	Hi end stop	5, 6 & 7	Peak for maximum.
6.	Repeat steps 4 & 5 until no further increase; then cement tuning cores in place.				
7.	ANTENNA TRIMMER		Weak station around 1400 Kc	7	With radio installed in car and antenna fully extended, peak antenna trimmer for maximum.

ALIGNMENT ADJUSTMENTS AND PARTS LOCATION

MOTOROLA INC.

AMERICAN MOTORS

MOTOROLA 6MR

8990377

American Motors 8990455, Motorola 7MR, is practically identical to the set described.

DIAL LIGHTING

Some receivers have a 270K 10% 1/2W resistor (Motorola Part No. 6R6414) in series with the dial scale. In the event that a dial scale is replaced and the dial scale found to be either too bright or too dim, either add (to reduce brightness) or remove (to increase brightness) the above resistor.

POINTER CALIBRATION

Remove the top cover and place the dial scale and pointer on the tuning shaft. With gang fully closed, loosen the tuning pulley setscrew, rotate the tuning pulley to position pointer as shown in Restringing Detail. Tighten the set-screw after calibration.

MOTOROLA INC.

MODEL
MoPar 624

Automotive type superheterodyne plated circuit chassis receiver designed for custom installation in the following 1957 DODGE cars: D66, D67, D70, D71, D72.

CAPACITORS - Decimal values in MF, all others in MMF unless otherwise specified.
VOLTAGES - Measured from point indicated to chassis with a VTVM, 100 ohm scale.
No signal input. Input voltage 13.2 VDC.

SERVICING PRECAUTION - When servicing this receiver, probing with a screwdriver (checking for spark to ground from various points) must be avoided, because the plate power is obtained directly from the storage battery and high currents can flow through the components causing permanent damage. The driver and transistor stages are especially susceptible to damage from this type of check. If the transistor BASE electrode is shorted to ground (either directly or through any other path) the BASE bias will be removed allowing excessive current to flow through the transistor causing permanent damage by melting the indium junctions in the transistor.

EMITTER CURRENT ADJUSTMENT - The emitter current is adjusted by variable resistor R-20 for 300 Ma flow through the transistor with 12 volts at the receiver's "A" lead. The current is adjusted by measuring the voltage drop across T-4 primary winding. Connect the negative lead of a low range VTVM to the yellow lead of T-4 (top of primary winding) and the positive VTVM lead to the red lead (bottom of primary) of T-4; adjust R-20 for a .51 volt reading.

ALIGNMENT ADJUSTMENTS LOCATION

MOTOROLA

MOTOROLA 75MF

FORD FEG-18806-H

(For alignment see the
next page adjacent at right)**SERVICE NOTES**

RADIO POLARITY - WHEN SERVICING THIS RECEIVER ON THE SERVICE BENCH, BE SURE THAT THE RECEIVER "A" LEAD IS CONNECTED TO THE POSITIVE SIDE OF THE POWER SOURCE AND THAT THE RECEIVER HOUSING IS CONNECTED TO THE NEGATIVE SIDE. IF CONNECTED OTHERWISE, THE RECEIVER WILL NOT OPERATE AND DAMAGE TO COMPONENTS MAY RESULT.

TRANSISTOR REPLACEMENT - When replacing a transistor, be sure that the transistor mounting screws are securely tightened. If not securely tightened, the transistor may be damaged from lack of proper heat dissipation. NOTE: When a transistor is replaced, the emitter current should be checked (see EMITTER CURRENT ADJUSTMENTS).

EMITTER CURRENT ADJUSTMENT - The emitter current is adjusted by variable resistor R-23 for 390 Ma flow through the transistor with 12 volts at the receiver's "A" lead. The current is adjusted by measuring the voltage drop across the top section of T-4 primary winding. Connect the negative lead of a low range VTVM to the yellow lead of T-4 (top of primary winding) and the positive VTVM lead to the white lead (tap on primary) of T-4; adjust R-23 for a .82 volt reading (see ALIGNMENT LOCATIONS photo).

DUMMY ANTENNA DATA

CORE ALIGNMENT TOOL DETAIL

6. **TRANSISTOR CHECK** - The transistors used in this receiver can be expected to give unusually long trouble-free life. However, the following transistor checks are provided to facilitate servicing:

Substituting a known good transistor for a suspected one is the simplest and most positive way of checking transistors.

The transistor may be checked for shorts and opens by using an ohmmeter. This check primarily measures the ability of a transistor to conduct current in one direction and to resist current flow in the opposite direction. The resistance in the conduction direction is very low in relation to the resistance in the non-conduction direction. This check is made by connecting the ohmmeter leads as shown in illustration.

TRANSISTOR CONNECTIONS

the next page adjacent at right)

IDENTITY ANTENNA DETAIL CORE ALIGNMENT TOOL DETAIL

(Alignment data on the next page)

COLLECTOR CURRENT ADJUSTMENT - The collector current is adjusted by variable resistor R-27, for a 870 Ma flow through the transistors, with 12 volts at the receiver's "A" lead. Separate the transistor mounting heat sink from the housing. Connect the negative lead of a low internal resistance milliammeter to the radio housing and the positive lead to the heat sink. Adjust variable resistor R-27, for 870 milliamperes.

NOTE: Internal resistance of milliammeter should not exceed .5 ohm.

T-2 COUPLING - The coupling of IF transformer T-2 has been increased by soldering a 1-1/2" length of insulated wire from pin #3 of T-2, and winding one turn of this wire around the plate lead of capacitor C-12. When replacing either T-2 or C-12, this wire should also be replaced. If omitted, the stopping accuracy of the receiver will be affected.

VOLUME R-17, MOST-OFTEN-NEEDED 1957 RADIO SERVICING INFORMATION

7.	ANTENNA TRIMMER		Weak station around 1400 Kc	7	With radio installed in car and antenna fully extended, peak antenna trimmer for maximum.

Circuit of MOTOROLA Models 845 and 846

NOTES:

TRANSISTOR REPLACEMENT - When replacing a transistor, set the transistor bias control resistor (R-23) to its maximum resistance position and be sure that the transistor mounting screws are securely tightened. Adhering to these precautions will prevent damage to the transistor from low bias and lack of heat dissipation.

EMITTER CURRENT ADJUSTMENT - The emitter current is adjusted by variable resistor R-23 for a 450 Ma flow through the transistor with 12 volts at the receiver's "A" lead. The current is adjusted by measuring the voltage drop across the top section of the output transformer T-4 primary winding. Connect the negative lead of a low range VTVM to the yellow lead of T-4 (top of primary winding) and the positive VTVM lead to the white lead of T-4 (lap on primary); adjust R-23 for a .85 volt reading.

MOTOROLA Models 845 and 849 Alignment Detail (Continued)

MODEL 845 ALIGNMENT DETAIL

MODEL 849 ALIGNMENT DETAIL

MOTOROLA

MoPar 918, used in 1957 Dodge D66, D67, D70, D71, D72.
Mopar 919, used in 1957 DeSoto S25, S26, S27, is very similar. Alignment information is on the next page, over.

NOTES:
CAPACITORS - decimal values in MF, all others in MMF unless otherwise specified.
VOLTAGES - measured from point indicated to chassis with a VTVM, $\pm 10\%$. No signal input.
INPUT VOLTAGE - 13.2 VDC
Resistors in Power Amp stage, make with transistor removed.

CAUTION
"A" LEAD MUST BE CONNECTED TO POSITIVE (+) SIDE OF POWER SUPPLY. RADIO WILL NOT OPERATE AND DAMAGE TO COMPONENTS WILL RESULT IF CONNECTED OTHERWISE.

EMITTER CURRENT ADJUSTMENT - The emitter current is adjusted by variable resistor R-24 for a 900 Ma flow through the transistor with 12 volts at the receiver's "A" lead. The current is adjusted by measuring the voltage drop across the primary winding of the output transformer (T-4). Connect the negative lead of a low range VTVM to the yellow lead of T-4 (top of primary winding) and the positive lead to the red lead of T-4 (bottom of primary); adjust R-24 for a .86 volt reading on VTVM.

TUBE CHECK - Substituting a known good tube for a suspected one is the best and only check recommended at this time.

MODEL 918 SCHEMATIC DIAGRAM

IMPORTANCE OF ANTENNA TRIMMER ADJUSTMENT - ANTENNA TRIMMER MUST BE PROPERLY PEAKED AT 1400 KC (WITH ANTENNA FULLY EXTENDED) TO INSURE CORRECT OPERATION OF SEARCH TUNER.

SERVICING PRECAUTION - When servicing this receiver, probing with a screwdriver (checking for spark to ground from various points) must be avoided, because the plate power is obtained directly from the storage battery and high currents can flow through the components causing permanent damage. The driver and transistor stages are especially susceptible to damage from this type of check. If the transistor BASE electrode is shorted to ground (either directly or through any other path) the BASE bias will be removed, allowing excessive current to flow through the transistor, causing permanent damage by melting the indium junctions in the transistor.

TRANSISTOR REPLACEMENT - When replacing a transistor, set the transistor bias control resistor (R-24) to its maximum resistance position and be sure that the transistor mounting screws are securely tightened. Adhering to these precautions will prevent damage to the transistor from low bias and lack of heat dissipation. NOTE: After replacing a transistor, adjust the EMITTER current as explained under EMITTER CURRENT ADJUSTMENT.

MODEL 918 ALIGNMENT ADJUSTMENTS

MOTOROLA

MODELS	CHASSIS
56T1A	HS-553
56T1B	HS-554

These sets are very similar to Chassis HS-483, Model 56T1, covered on page 65, of the "Most-Often-Needed 1956 RADIO Diagrams" manual. In fact, Model 56T1B may be considered a later version of these earlier sets. In servicing, changes in 56T1B circuit may be followed to secure improved operation. For alignment trimmer locations refer to the prior volume mentioned.

Resistances measured with transistor out of associated circuit.
*These capacitors may be built into the IF transformers on some sets.
R19 value selected during production to adjust gain of set. Values from 68K to 120K may be used. Not used in all sets, however.

NOTES:
Capacitors - Decimal values in MF, all others in MMF unless otherwise specified.
Voltages - Measured from point indicated to braided lead ground with a VTVM. No signal input, vol. at max. Tuning range - 530 to 1620 KC.
IF - 455 KC.

MOTOROLA

**RECORD CHANGER
MODEL BR2RC
PART NO 59D636270**

STYLUS RENEWAL

(Service material below and on the next eight pages.)

To renew a SONOTONE stylus, gently lift tone arm and lift stylus retaining latch, then remove stylus and selector bar as a single unit. When installing new stylus, be sure stylus rests in V. Replace with SONOTONE No. N-2TS (Motorola Part No. 47K632185).

OPERATING INSTRUCTIONS

This record changer will operate only on 117 volt 60 cycle AC.

Loading.--Lift the record control arm by holding it at the far end (i.e., end furthest away from the center spindle) and then swing it clear of the records. Then, taking each record singly, place it on the center spindle resting the first record on the spindle ledge. Hold the record in position with the left hand and load the others with the right hand in the same way. When all records are in position, replace the record control arm over the center spindle. If the records are all of one diameter, it may be more convenient to group the ten together; see that the center holes are all in line and place the group on the center spindle.

Starting Up.--Make sure that the pickup stylus is correct--that is, either 78 or 33-45 and similarly the speed knob. The Pickup is correctly set for 78 RPM records when knob at the front of the Pickup is so positioned that the number 78 (Std) is upright. To position the Pickup for long-playing records, the numbers 33-45 (LP) must be upright. Then move the On/Off/Manual/Reject Knob to the left firmly but not too roughly. That is all that is required.

Rejecting.--To reject a record, merely move the On/Off/Manual/Reject Knob to the LEFT.

When the last record is finished the machine will switch itself off automatically.

Manual Operation.--To play records singly on the record changer, the following procedure should be adopted: Place desired record on the turntable manually and replace control arm in its operating position. Turn On/Off/Manual/Reject switch to the "Manual" position only. The turntable will now revolve at the selected speed. Lift the Pickup off its rest and place in position on record. The record will now play and when completed the Pickup will return to rest and the unit will switch off automatically in the normal manner.

To Remove the Records.--Lift the record control arm and turn it out of the way. Grasp the records together and lift them gently from the center spindle, easing them past the ledge on the spindle.

After loading always see that the Magidisk Record Selector Arm (Item 8M139) is out and not stuck in a vertical position. In other words, it must be BELOW the records.

**GENERAL INFORMATION**

This record changer is designed to play all of the existing types of phonograph records in common use. First, there is the record that rotates at a speed of 78 revolutions per minute. This type has been in common use for many years. Generally, this record is produced in two diameters, 10" and 12", playing respectively about 3-1/2 and 5 minutes per side. This record changer will play a total of ten records of average thickness at one loading, and the different diameters can be mixed; the machine itself will select the correct conditions for each diameter WITHOUT any adjustment. The only manual adjustment necessary is to turn the Pickup to the 78 position and rotate the speed control knob to the 78 position.

Secondly, there is the record that rotates at 33-1/3 revolutions per minute. This is commonly called the LP or long-playing type. It is generally produced in two diameters--12" and 10". The playing time is much longer per side than with the old 78 RPM type. Thus, one side of the 12" diameter can play up to 20 minutes. Again this record changer will accept a mixed loading of the different diameters and will automatically select the correct conditions for each. Again the only manual adjustments are the Pickup to the 33-1/3 position and the speed changer knob also to the 33-1/3 position.

Thirdly, there is the record that rotates at 45 revolutions per minute. This is only produced in the 7" diameter size. Some of these records are sold with a large center hole which must have an adaptor plate fitted to reduce the hole size to the common standard to fit the center spindle. The more recent tendency is to sell 45 RPM records with the standard small hole, allowing this center to be pushed out when the large hole is required. With these records the speed must be set to the 45 position and the Pickup set to the 33-1/3 position.

Fourthly, there is the record that rotates at 16-2/3 revolutions per minute. This is, at present, only produced in the 7" diameter size. Generally speaking, it is advisable to play these records singly. Some of these records are manufactured with a very large center hole. In such cases, they are sold with a special cardboard adaptor which reduces this hole to the standard size for normal use. Many records are, however, manufactured with the small standard center hole. With these records, set speed change knob to the 16-2/3 position and the Pickup to the 33-1/3 position.

VOLUME R-17, MOST-OFTEN-NEEDED 1957 RADIO SERVICING INFORMATION

MOTOROLA Record Changer Model BR2RC Service Material, Continued

LUBRICATION

A periodic check should be made to insure that your changer is lubricated adequately at the points detailed below:

Heavy grease should be used on the following points:

- Main slide (Item 8M162), grease faces rubbed by cam (8M168), and also end of tongue.
- Actuating lever (8M152), grease inside face of pawl resetting strip.
- Reset arm (8M204), grease portion that rubs on cam gear (8M160).
- Main sub-plate (8M169), grease guide slots.
- Ballrace (8M68), fill ballrace cup with grease and assemble with open end upwards.
- Four speed pawl (8M52), grease nose of pawl.
- Speed change slide (8M44), grease location steps.

Light oil should be used on the following points:

- Control spindle (8M4), oil spindle.
- T. T. Bearing (8M63 and 8M65).
- Rivet (8M135), oil sparingly taking care not to drip oil down on to plastic selector arm bearing (8M138).
- Rivet (8M116).
- Jockey pulley bearing (8M33).
- Speed change slide (8M44), oil portion of mainplate over which slide moves.

PLEASE NOTE

No oil should be used on the Magidisk Record Selector Bearing (see Figure 7).

ADJUSTMENTS

Needle Set-Down. --The set-down position of the needle on the record is adjusted by manipulation of the needle adjusting screw (Item 8M261). (See Figure 4.) Adjust this screw until the correct set-down of the needle on a 10" record is obtained. The correct position is 1/8" from the edge of the record. It is advisable to make this adjustment with a stack of 10" records on the turntable. When correctly positioned for a 10" record, the 12" and 7" needle set-down will also be correct.

Pickup Arm Height. --The pickup arm height is adjusted by the pickup height adjusting screw (Item 8M257). (See Figure 4.) To raise the height of the pickup arm, turn this screw counterclockwise. To lower the pickup arm turn clockwise. The pickup height should be adjusted so that with a stack of ten average thickness records on the turntable, the point of the needle clears the top record by 1/16 inch. A check should then be made to insure that the pickup

arm clears the underside of records loaded on the center spindle.

Needle Pressure. --Adjustments may be made by repositioning the pickup balance spring (Item 8M263) in the various adjusting holes provided (see Figure 4) until the correct pressure is obtained.

Adjusting of Speed Change. --

- Set the four speed knob at the 16-2/3 RPM position.
- Slacken setscrews on the 4-speed pulley (Item 8M94) and adjust until the jockey pulley (Item 8M32) is engaged on the smallest pulley diameter just clear of the top step (see Figure 2).
- Tighten setscrews.

DISMANTLING

(1) Turntable Assembly (Item 8M62A)

Remove circlip (Item 8M109) and lift the turntable vertically upwards over the center spindle. Take care not to lose the thin thrust washer (that sticks to underside of turntable boss), ballrace of second thrust washer. NOTE: Before replacing assembly, set speed knob to 45 RPM. This allows easy maneuverability of jockey pulley when replacing turntable, without possible danger of bending jockey arm.

(2) To Remove Control Arm Assembly (Item 8M2A) (See Figure 7)

Remove pin (Item 8M5) on underside of control arm spindle (Item 8M4) (See Figure 3).

(3) Pickup Arm Assembly

This must be done after the changer has switched itself off. Unsolder the pickup leads from the connecting tagstrip. Unscrew the pickup top bearing (see Figure 4) and then lift the pickup arm clear. Replace the pickup top bearing to avoid losing the spacer washer.

(4) Main Sub-Assembly

Remove turntable and pickup arm as described and 3 screws (Items 8M114, 8M115 and 8M190) holding sub unit. Main sub-assembly can then be gently removed from unit-plate.

(5) Sonotone 2TS Cartridge (from pickup arm)

Unscrew the two self-tapping screws securing the cartridge bracket to the arm moulding. Ease the two pickup lead tags from the lugs at the rear of the cartridge case.

TROUBLE SHOOTING CHART

SYMPTOMS	CAUSE	REMEDY
I. Turntable does not rotate when On/Off/Reject Knob is turned to "ON"	(1) No current to motor	- Check that current has reached record changer motor. - Check that switch box assembly is functioning correctly. - Check all wiring and solder terminals to and from the switch box assembly (see Figure 1).
	(2) Motor defective	- Remove the turntable and allow the motor to operate without load. If motor spindle is not rotating and voltage is reaching the motor, the motor is faulty. Repair or replace. - Check that the 4-speed pulley (Figure 2) is not loose on motor spindle. If loose adjust as under "Adjustments of Speed Change".
	(3) Jockey pulley not engaging turntable rim.	- Check that the jockey pulley is free to pivot. - Check that the jockey pulley spring is correctly positioned (see Figure 2).

MOTOROLA Record Changer Model BR2RC Service Material, Continued

TROUBLE CHART - Cont'd

SYMPTOMS	CAUSE	REMEDY
		(c) Carefully clean the inside rim of turntable and rubber tire on jockey pulley to insure that they are free from oil and grit.
II. Turntable revolves when On/Off/Reject Knob is turned to "ON" but pickup remains stationary on its rest.	(1) Incorrect manipulation of control.	Insure that the On/Off/Reject knob is turned to its full-ext extremity in the "ON" direction. This does not apply when operating the changer manually.
III. Pickup lifts but fails to move in when record drops. The pickup returns to rest and the turntable continues to revolve	(1) Stop pin (Item 8M199)(see Figure 3) not dropping freely. (2) Adjusting link (Item BM208) too tight (see Figure 3). (3) Stiffness in stop bracket assembly bearing (see Figure 3)	Remove all grease, oil, grit, burrs or rust carefully from the stop pin and spring (Item BM201) and insure that spring is not damaged. Slacken adjusting link by decreasing bend. Free and lightly oil.

FIGURE 1.

FIGURE 2.

FIGURE 3.

VOLUME R-17, MOST-OFTEN-NEEDED 1957 RADIO SERVICING INFORMATION

TROUBLE CHART - Cont'd

SYMPTOMS	CAUSE	REMEDY
IV. Pickup lifts but fails to move in when record drops. Pickup returns to rest and changer switches off.	(1) Cut off arm (Item 8M228) (see Figure 3) not returning to neutral position. (2) Undue friction at stop lever assembly bearing (see Figure 3) (3) Stiffness in stop bracket assembly bearing (see Figure 3)	(a) Cut off arm spring (Item 8M227) (see Figure 3) damaged. Replace. (b) Friction on moving surfaces of cut off arm. This lever must be absolutely free to slide in its slots. Check for rust, frays in slots, etc. Remove, clean and lightly oil. Free and lightly oil.
V. Pickup arm strikes record on spindle when it rises or needle catches on last record when it moves out.	(1) Pickup arm height not adjusted properly. (2) Control arm (Item 8M2) not holding records level. (3) Needle bent in crystal cartridge	See instructions for "Adjusting Pickup Arm Height" under "Adjustment". Hold control column securely and twist control arm until it will hold record stack parallel to top of turntable (see Figure 3). Replace needle. (See necessary instructions under "Dismantling".)
VI. Turntable speed too slow.	(1) Tightness in motor bearing. (2) Binding in turntable bearing. (3) Jockey pulley slip. (4) Input voltage too low (5) Operating temperature too low. (6) Undersized 4-speed pulley	Tap lightly the side of motor laminations to free self-aligning bearings. Check turntable bearing for freedom. If it does not turn easily when disengaged from the jockey pulley assembly (Item 8M32A) remove turntable, clean off foreign matter and lubricate with light mineral oil. Remove turntable and clean rim of jockey pulley. Oil jockey unit joints and pivots and make sure all move freely. Remove any trace of oil on jockey pulley rubber or inside of turntable rim. The input voltage should be not less than 100 volts. If the machine has been standing in a cold place or operated in surroundings at a temperature of less than 45°F, the turntable speed may be too slow initially. Remove turntable and fit new 4-speed pulley. Pulleys are available as follows: Small-red pulley; Medium-green pulley; Large-blue pulley. To increase turntable speed remove existing pulley from the motor shaft and fit the next size larger, or vice versa to reduce speed. When fitting new 4-speed pulley see "Adjustments of Speed Change" under "Adjustments".
VII. Turntable speed too fast.	(1) Input voltage too high. (2) Oversize 4-speed pulley.	Replace 4-speed pulley as instructed at "6" under "Turntable Speed Too Slow"
VIII. Changer continues to cycle. With pickup dropping on to record during every cycle.	(1) Pawl reset strip (see Figure 5) distorted. (2) Actuating pawl and friction link assembly (see Figure 5) too free.	Make sure that this strip is straight and resets friction link (Item 8M154) and actuating pawl (Item 8M156) by engaging with friction link shoulder during cycle (see Figure 5). Damp down the bearings of this assembly by smearing with medium grease.
IX. Noise during playing of record.	(1) Motor rumble. (2) Defective turntable bearing. (3) Defective jockey pulley. (4) Defective records (5) Squeaks	If a low pitched rumbling sound comes from the loud-speaker while the record is being played, check the motor rubber mountings to be sure the motor is freely suspended on them. The motor lead wires should have slack to allow the motor to float. Check for foreign matter in the bearings, defective balls, binding between balls, ball cage and thrust washers. Grease ballrace and washers. Lubricate with light mineral oil. A rapid thumping sound while the motor is running may indicate a flat on the motor jockey pulley (Item 8M32) (Figure 2). If this condition has not cleared up after 10 minutes of running time, remove the turntable and check the rubber tire on the jockey pulley. If the surface is not smooth, replace the jockey pulley. Should the bearings of the jockey assembly show signs of excessive wear, replace the jockey unit assembly. Worn or defective records cause needle scratch and distortion of the recorded sound. If the record is warped it may slip on the other records causing "wow". An enlarged hole in the record can also cause "wow". Squeaking sounds as the changer operates indicates a lack of oil. Lubricate.
X. Distortion of recorded sound.	(1) Defective record. (2) Defective amplifier. (3) Bad cartridge. (4) Dust on needle.	(See "4" under "Noise during playing of record.") Check both amplifier and speaker. Replace. (See instructions under "Dismantling".) Brush off dust with finger.
XI. No sound during playing.	(1) Defective cartridge. (2) Defective wiring. (3) Defective amplifier. (4) Loose cartridge socket tags.	Replace. (See instructions under "Dismantling".) Check pickup leads for short or open lead. Check amplifier and speaker. Remove, tighten slightly and replace.

FIGURE 4.

FIGURE 5.

FIGURE 6.

FIGURE 7.

FIGURE 6.

TROUBLE CHART - Cont'd

SYMPTOMS	CAUSE	REMEDY
XII. Changer does not shut off after last record has been played, possibly continuing to play the last record from the 7" position.	(1) Control arm (Item 8M2) (Figure 8) binding. (2) Adjusting link (Item 8M208) broken, disconnected or too slack (see Figure 3). (3) Stop pawl spring (Item 8M17) loose, broken or faulty (see Figure 3). (4) Undue friction at stop lever assembly bearing (see Figure 3).	The record control arm must drop below the offset shoulder of the center spindle or the changer will not shut off. Replace or repair. } Tighten adjusting link by increasing bend. Replace or repair. Remove, clean and lightly oil.
XIII. Changer returns pickup to rest before all records have been dropped. Turntable continues to revolve or changer switches itself completely off.	Adjusting link (Item 8M208) too tight (see Figure 3).	Slacken adjusting link by decreasing bend (see Figure 3)
XIV. 4-speed knob (Figure 7) does not select 16, 33, 45 or 78 when registering that speed.	Speed change wrongly adjusted.	Refer to "Adjustments of Speed Change" under "Adjustments".
XV. Record does not drop when changer cycles.	(1) Record feed spindle (Item 8M107) (Figure 6) broken. (2) Record feed lever (Item 8M104) (Figure 6) broken.	Replace record feed spindle or complete center spindle. Replace record feed lever or the complete center spindle.

VOLUME R-17, MOST-OFTEN-NEEDED 1957 RADIO SERVICING INFORMATION

MOTOROLA Record Changer Model BR2RC Service Material, Continued

TROUBLE CHART - Cont'd

SYMPTOMS	CAUSE	REMEDY
XVI. Two records drop at once.	(1) Hole in record too large. (2) Record keeper (Item 8M100) (Figure 6) not fully down. (3) The record control arm (Item 8M2) not holding records level.	Replace record. Carefully clean and remove burrs. Do not oil. It should fall under its own weight. Refer to Figure 8. Hold control column securely and twist control arm until it will hold record stack parallel to top face of turntable.
XVII. P. U. does not locate correctly on records.	(1) Rubber buffer (Item 8M240) missing or misplaced at rear of P. U. arm. (2) Pickup arm not adjusted properly. (3) Needle bent.	Replace rubber buffer (Item 8M240) in small hole in the side of the P. U. arm just behind the hinge. Slip eyelet (8M239) over stem of rubber inside arm and clamp tightly. See "Needle Set-Down" under "Adjustments". Replace with new needle. (See necessary instructions under "Stylus Renewal".
XVIII. Pickup remains on record run-out groove, or on last groove.	(1) No finishing run-out groove on record. (2) Needle jumps out of groove in record. (3) Faulty actuating pawl and friction link (see Figure 5).	Check record for eccentric run-out groove in center of record. Some old records and home recordings do not have this eccentric run-out groove. (a) Check that needle pressure is correct -should be 8-10 grams. (b) Check that the record is not defective -the run-out groove is often too shallow. (c) The needle point might be damaged or affected by excessive accumulation of dust. Replace or clean. (d) There may be binding in the pickup spindle bracket (Item 8M182 and Items 8M173 and 8M181). Insure that all moving parts are free and lightly oiled. When friction link has been moved towards center of gear wheel and then slowly pushed outwards, it should also carry the actuating pawl outwards from the start of its movement. If the pawl does not move freely with the link, it will not engage the turntable boss to start cycle. Dismantle link and pawl, clean, reassemble and oil. Take care with tiny spring between the two parts.
XIX. Pickup does not move in when set down on record.	No run in groove on record.	Check that the record is of the standard type which has a run-in groove from the outside edge of the record to the recorded section. Some old type records and home recordings do not have this run-in groove.
XX. Needle does not track across record properly.	(1) Needle may be clogged with an accumulation of dust or be worn. (2) Pickup leads too tight. (3) Changer not level. (4) Binding or friction in the pickup spindle bracket assembly. (Figure 4) (5) Needle pressure insufficient. (6) Actuating lever (Item 8M152) (Figure 5) not free on slide. (7) Pickup hinge fouling pickup cover (Figure 4). (8) Worn records or records with damaged groove. (9) Pickup spindle bracket (Item 8M182) fouling tongue on stop plate (8M185) in down position of pickup spindle bracket.	(a) Clean the foreign material from around the needle. (b) Check needle to see if the tip is broken or bent and replace if necessary. (To replace see necessary instructions under "Dismantling". Give the pickup leads enough slack to allow the tone arm to move freely across the record. Insure that the changer is level before use. Insure that all moving parts and bearing surfaces in this assembly are free and lightly oil. Check as under "Adjustments". This lever must be absolutely free to slide in slots. Check for bending, rust, frays in slots, etc. Bend hinge up to clear. Replace record. (a) Clear dirt. (b) Bend tongue to clear.
XXI. Pickup does not locate on pickup rest	Tongue on stop plate (Item 8M185) not locating in pickup spindle bracket (Item 8M182) due to pin (8M164) being out of line.	Adjust pin (8M164) by bending arm of main slide pressing so that the tongue on (Item 8M185) will slip into the notch on (Item 8M182) when the radial faces of the two pressings are against the pin.
XXII. Turntable slips or stalls.	(1) 4-speed knob not set in correct position. (2) 4-speed knob in neutral. (3) Jockey pulley slipping. (4) Insufficient tension on jockey pulley spring (8M48).	Move knob slightly to allow pawl (8M52) to fall into notch in slide. Set on correct speed. Remove turntable and carefully clean all traces of oil off inside of arm, off jockey pulley tire, and off 4 step pulley. Replace spring.

PICKUP ARM ASSEMBLY

FIGURE 11.

OLYMPIC RADIO & TELEVISION INC.

MODEL 404

ALIGNMENT INSTRUCTIONS:

The chassis must be removed from the cabinet before alignment can be performed. Before removing the chassis pull off the two knobs, one on each side of the cabinet. At the rear of the cabinet, remove the four screws which hold the antenna loop back to the cabinet. Then remove the three screws which hold the chassis to the cabinet. The chassis can then be easily removed.

Equipment required: Modulated RF signal generator; output meter; insulated screw-driver, two .1 mfd 600 volt condensers. To insure proper alignment, a radiated signal will be required during part of the alignment procedure. To radiate a signal, connect a loop of about 6 inches in diameter (one turn of #14 or #12 wire) across the output of the signal generator, and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 10 or 12 inches.

Connect the output meter and signal generator as follows:

Output meter: Connect across the speaker voice coil and turn the volume control to maximum (extreme clockwise position).

Signal generator: When the generator is not used to radiate a signal, connect the low side to the receiver chassis through a .1 mfd condenser, clip the high side through a .1 mfd, 600 volt condenser to the point at which signal injection is required, and keep the output as low as possible. Proceed in the sequence shown in the alignment chart.

When the alignment process is completed, turn the tuning knob shaft until the tuning condenser plates are full meshed. Replace the chassis inside the cabinet, insert and tighten the screws previously removed, and mount each knob on its shaft at the side of the cabinet. With the condenser plates fully meshed, place the tuning knob on its shaft so that the horizontal line at the "55" end of the knob is adjacent to the indicating marker on the cabinet.

ALIGNMENT PROCEDURE CHART

ALIGNMENT PROCEDURE (CONT.)				
STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO--	SET SIGNAL GENERATOR TO--	TURN RECEIVER DIAL TO--	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE.)
1	ANTENNA SECTION TUNING CONDENSER IN SERIES WITH .1 MFD COND. 			

Frequency Range: 540-1620 KC

Power Requirement: 105-120 volts alternating current 60 cycles, or 105-120 volts direct current.

Power Consumption: 25 watts.

OLYMPIC RADIO & TELEVISION INC.

MODEL 407

ALIGNMENT

The chassis must be removed from the cabinet before alignment can be performed. To remove chassis, 1) remove the cabinet back with loop antenna and line cord, 2) pull the two knobs off the front of the cabinet, 3) unscrew the one screw located behind the tuning knob from the front of the cabinet, 4) slide the chassis out of the cabinet.

Equipment required: Modulated RF signal generator; output meter; insulated screw-driver, two .1 mfd 600 volt condensers.

To insure proper alignment, a radiated signal will be required during part of the alignment procedure. To radiate a signal, connect a loop of about 6 inches in diameter (one turn of #14 or #12 wire) across the output of the signal generator, and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 10 or 12 inches.

Connect the output meter and signal generator as follows:

Output meter: Connect across the speaker voice coil and turn the volume control to maximum (extreme clockwise position).

Signal generator: When the generator is not used to radiate a signal, connect the low side to the receiver chassis through a .1 mfd condenser, clip the high side through a .1 mfd, 600 volt condenser to the point at which signal injection is required, and keep the output as low as possible. Proceed in the sequence shown in the alignment chart.

 1. ALL RESISTORS $\pm 20\%$ TOLERANCE, $\frac{1}{2}$ WATT, UNLESS OTHERWISE SPECIFIED.
 2. ALL VOLTAGES MEASURED BETWEEN POINTS INDICATED AND B- WITH VOLUME CONTROL FULL ON, USING 20,000 OHMS-PER-VOLT METER. ALL VOLTAGE READINGS $\pm 10\%$, MEASURED ON ELECTRIC POWER OPERATION WITH INPUT VOLTAGE OF 117 V., 60 CYCLES, A.C.
 * 3. CERAMIC CONDENSER, DISC TYPE.

OLYMPIC RADIO MODEL NUMBER 447

Alignment Instructions:

Equipment required: Modulated RF signal generator; output meter; insulated screw-driver. two .1 mfd 400 volt condensers.

To insure proper alignment, a radiated signal will be required during part of the alignment procedure. To radiate a signal, connect a loop of about 6 inches in diameter (one turn of #14 or #12 wire) across the output of the signal generator, and place this loop parallel to the loop of the receiver to be aligned, at a distance of about 10 or 12 inches. Connect the output meter and signal generator as follows:

Output meter: Connect across the speaker voice coil and turn the volume control to maximum (extreme clockwise position).
Signal generator: When the generator is not used to radiate a signal, connect the low side to the receiver chassis through a .1 mfd condenser, clip the high side to the point at which signal injection is required, and keep the output as low as possible. Proceed in the sequence shown in the alignment chart.

ALIGNMENT PROCEDURE CHART

STEP	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO -	SET SIGNAL GENERATOR TO -	SET DIAL KNOB CALIBRATION TO (ALIGN WITH LINE ON CABINET)	ADJUST THE FOLLOWING FOR MAXIMUM OUTPUT. (KEEP SIGNAL FROM SIGNAL GENERATOR AS LOW AS POSSIBLE.)
1	R. F. SECTION OF VARIABLE CONDENSER IN SERIES WITH A .1 MFD. 400 VOLT CONDENSER.	455 KC.	EXTREME COUNTER POSITION (CONDENSER PLATES FULLY OPEN)	L4, L3, L2 AND REPEAT IN SAME ORDER (1st. AND 2nd. I. F. TRANSFORMERS.)

5	REPEAT STEPS 2, 3 & 4 AT LEAST TWICE TO INSURE MAXIMUM SENSITIVITY & PROPER DIAL TRACKING			

Packard Bell

MODEL 4RB1 PORTABLE BATTERY RADIO

ALIGNMENT PROCEDURE:

Alignment is accomplished by following the steps in the chart below. Connect output meter to speaker voice coil. Connect test oscillator through a .01 mfd capacitor to pin 6 (grid 3) of V-1 for the first step. Ground lead of generator goes to chassis. For steps two and three, couple generator loosely to ferroloop with three or four turns of wire. Each adjustment should be made using a minimum input signal.

STEP	CONNECT TEST OSCILLATOR TO	TEST OSCILLATOR FREQUENCY	RADIO DIAL SETTING	ADJUST
1.	Pin 6, V-1 (1R5)	455 kc	535 kc	S-1, S-2, S-3, & S-4 for MAX.
2.	Couple to loop	1620 kc	1620 kc	C-2B for MAX.
3.	Couple to loop	1500 kc	Tune to test osc. signal	C-1B for MAX.

Secondary, 44 ohms

2nd I-F Coil:

Primary, 44 ohms
Secondary, 44 ohms

Ferroloop antenna:

3.6 ohms

*Packard-Bell***MODEL 5R1
TABLE MODEL RADIO****ALIGNMENT PROCEDURE:**

The alignment of the set is accomplished by following the steps in the chart below. Connect output meter to speaker voice coil. Use isolation transformer, if available, for shock protection.

Each adjustment should be made using a minimum input signal. Connect test oscillator through a .01 mfd capacitor to the point indicated below. Ground lead of oscillator is connected to B minus bus.

STEP	CONNECT TEST OSCILLATOR TO	TEST OSCILLATOR FREQUENCY	RADIO DIAL SETTING	ADJUST
1.	Pin 1, V-1 (12BE6)	455 Kc.	540 Kc.	S-1, S-2, S-3, & S-4 for MAX.
2.	Antenna Clip	1620 Kc.	1620 Kc.	S-5 for MAX.
3.	Antenna Clip	1500 Kc.	Tune to Osc. Signal	S-6 for MAX.

**Socket voltages measured as follows:**

1. Line voltage, 117 volts AC.
2. Volume control at maximum.
3. VTVM between socket terminal and B minus bus.
4. Only DC voltages measured. Allow 10% tolerance.

SPECIAL SERVICING INFORMATION:**DC RESISTANCE MEASUREMENTS:****1st I-F Coil:**

Primary, 12 ohms
Secondary, 13 ohms

2nd I-F Coil:

Primary, 13 ohms
Secondary, 13 ohms

Oscillator Coil:

Primary, 1 ohm
Secondary, 5.5 ohms

Loop Antenna:

Resistance, 1 ohm

OSCILLATOR CATHODE VOLTAGES:

(Measured using AC vacuum tube voltmeter with an input impedance of more than 10 megohms. Line voltage 117 volts AC.)

1500 Kc.	2.6 volts AC (rms)
1000 Kc.	2.3 volts AC
750 Kc.	2.1 volts
540 Kc.	2.0 volts

PHILCO

PHILCO MODEL: C-5690(HR)

(Philco material in this manual is reproduced through the courtesy of the Philco Corp.)

CIRCUIT CHANGES

Resistor R55 was changed from 150,000 ohms to 220,000 ohms, part No. 66-4228340.

Resistor R45 was changed from 22,000 ohms to 82,000 ohms, part No. 66-3828340.

A 47-ohm, 1/2-watt resistor, part No. 66-0478340, was added between emitter detector transistor L-5113 and the junction of R52-C35. A .1-μfd capacitor, part No. 30-1260, was added between the emitter of Detector Transistor L-5113 and ground.

Resistor R15, was changed from 1.8K to 2.7K ± 10%, part No. 66-2278340.

Resistor R29 was changed from 10 ohm ± 5% to 8.2 ohms ± 5%, part No. 66-9823260.

Resistor R23 was changed from 33,000 ohms to 10,000 ohms, part No. 66-1038340.

SERVICE HINTS

1. All units are wired for connection with NEGATIVE GROUND. If the set is connected backwards, the motor will drive in reverse (from high frequency end to low frequency end) and the 1 ampere fuse will blow out.

2. If the motor is reversed or the latching pawl is accidentally tripped before tuning reaches the high frequency end, a number of clockwise revolutions of the manual tuning knob may be required to again engage the cam.

3. Where a set is dead or inoperative, first check the radio in the car to make sure there are jumpers in the rear seat speaker, and phono sockets. See figure 3.

4. When soldering any transistor lug, turn the set off and remove the transistor to prevent any damage to the transistor from any AC leakage from the soldering iron.

5. CAUTION: Do not ground the base of any of the transistors or serious damage will result to the transistor.

RELAY CURRENT ADJUSTMENT

If the relay control transistor, AR-3, is defective and needs replacement the 40,000 ohm relay control bias potentiometer, R27, must be adjusted as follows:

Connect a milliammeter between contact 5 of relay S2 and ground, and adjust the relay control bias pot, R27, until 13 milliamperes is indicated on the meter.

PHILCO AUTO RADIO

MODEL M-5741

PHILCO

E-670, E-672, E-675 AND E-676

ALIGNMENT PROCEDURE

General—Allow set and test equipment to warm up for fifteen minutes before starting the alignment.

Dial Indicator—Before alignment, the dial knob should be set as follows: with the condenser gang plates fully meshed, the indicator on knob should be pointing straight up.

Output Indicator—Connect a 1000-ohms-per-volt a-c voltmeter or an oscilloscope across the voice-coil terminals.

Signal Generator—Use an AM r-f signal generator. Connect the ground lead to B—, and connect the output lead as indicated in the alignment chart.

Output Level—Attenuate the signal-generator output throughout the alignment so as to maintain the output below .4 volts.

Radio Controls—Set the volume control to maximum. Set the tuning control as indicated in the alignment chart. It is recommended that a-c power be used when aligning the radio.

Note: Insulated shield around 1U4 must be in place to eliminate oscillation.

ALIGNMENT CHART

STEP	SIGNAL GENERATOR CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	RADIO SPECIAL INSTRUCTIONS	ADJUST
1	Connect signal generator through a .1 mfd condenser to pin 6 (converter grid) of 1R5.	455 kc.	Tuning gang fully open.	Adjust for maximum output in order given.	TC3—2nd I-F sec. TC2—1st I-F sec. (top Z1) TC1—1st I-F pri. (Bot. Z1)
2	Use radiating loop (See note one below).	1620 kc.	1620 kc. (See note 2 below.)	Adjust for maximum.	C1B—osc. trimmer
3	Same as step 2.	1400 kc.	1400 kc. (Tune for signal.)	Adjust for maximum.	C1A—ant. trimmer

NOTE 1: Use a 6- to 8-turn, 6 inch diameter loop made up of insulated wire. Connect to generator terminals, and place about one foot from radio loop.
NOTE 2: The tuning condenser can be set to the proper frequency for the oscillator adjustment as follows: Fully open the tuning gang and insert a .005 non-metallic shim between the heel of the rotor and the top of the stator plates. Close the gang sufficiently to hold the shim in place, and then remove the shim without disturbing the gang setting.

PHILCO Models E-740, E-742, E-810, E-812, E-814, and E-816

(Continued from the preceding page at left)

Printed Panel Component Layout—Models E-740, E-808, E-810, E-812, E-814 and E-816

Printed Panel Component Layout—Model E-742

Frequency Range—540 KC to 1620 KC.

Intermediate Frequency—455 KC.

Audio Output—.9 watt.

Power Consumption—30 watts.

Operating Voltage—E-740 and E-742, 105 to 120 volts, 60 cycles; E-808, E-810, E-812, E-814, and E-816, 105 to 120 volts, AC-DC.

Aerial—High Impedance loop mounted on inside of back.

ALIGNMENT PROCEDURE

Radio Controls—Set volume control to maximum. Set tuning control as indicated in chart.

Output Meter—Connect across voice coil terminals.

Signal Generator—Connect generator and set frequency as indicated in chart. Use modulated output, 30%.

Output Level—During alignment, adjust signal-generator output to hold output-meter reading below .5 volts.

SPEAKER PHASING (Model E-816 Only)

When replacing or reconnecting the two, paralleled speakers, it is possible that an out-of-phase condition may exist. This is readily apparent by weak output and serious distortion. To correct, interchange the leads to one of the speakers.

CHASSIS REMOVAL

- (1) Remove Back: In models E-808 and E-810 there are two screws holding the back to the cabinet. In models E-710, E-742, E-812, E-814 and E-816, spring the cabinet top to allow the back top to come back and out. Then lift (or slide upwards) the back to free back from bottom slots. Disengage interlock.
- (2) Remove the drive screw which holds the volume control frame to a boss on inside of cabinet front.
- (3) It may be desirable or necessary to unsolder the two speaker leads to obtain full chassis freedom.

ALIGNMENT CHART

STEP	SIGNAL GENERATOR		RADIO		ADJUST
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	
1.	Ground lead to B-; output lead through a .1 mf condenser to grid (pin 7) of 12BE6.	455 kc.	Tuning gang fully open.	Adjust tuning cores, in order given, for max. output. TC1 and TC3 are located on top of transformers.	TC4—2nd i-f sec. TC3—2nd i-f pri. TC2—1st i-f sec. TC1—1st i-f pri.
2.	Radiating loop (See note below).	1620 kc.	1620 kc.*	Adjust for maximum output.	C1-B—osc.
3.	Same as Step 2.	1500 kc.	1500 kc.	Adjust for maximum output.	C1-A—aerial.

Note: Make up a 6-B turn, 6 inch diameter loop from insulated wire, connect to signal generator leads, and place near radio loop.

* For proper adjustment of the oscillator trimmer, fully open the tuning gang and insert a .006 inch non-metallic shim between the heel of the rotor and the top of the stator plates. Close the tuning gang sufficiently to hold the shim in place, and then remove the shim without disturbing the gang setting.

1	Ground lead to 8—; output lead through a .1 mf condenser to grid (pin 7) of 12BE6.	455 kc.	Tuning gang fully open.	TC4—2nd i-f sec. TC3—2nd i-f pri. TC2—1st i-f sec. TC1—1st i-f pri.
2	Radiating loop. (See note below).	1620 kc.	1620 kc. *	C1-B—osc.
3	Same as Step 2.	1500 kc.	1500 kc.	C1-A—aerial.

Note: Make up a 6-8 turn, 6 inch diameter loop from insulated wire, connect to signal-generator leads, and place near radio loop.

* For proper adjustment of the oscillator trimmer, fully open the tuning gang and insert a .006 inch non-metallic shim between the heel of the rotor and the top of the stator plates. Close the tuning gang sufficiently to hold the shim in place, and then remove the shim without disturbing the gang setting.

PHILCO MODEL E-976

(For alignment see the next page adjacent at right)

Audio Output — 1 watt
Variable bass boost or treble cut tone control
Operating Voltage — 105 - 125 volts, a.c./d.c.
Power Consumption — 40 watts
Antennas — AM — Built in high impedance, pancake loop
FM — Line cord with provision for connecting external antenna.
Intermediate Frequency — AM 455 KC
FM 10.7 MC

SPECIFICATIONS

Cabinet — Wood table model — Mahogany, Blonde or Fruitwood. Dual slide-rule dial with neon band indicators.
Circuit — Seven-tube superheterodyne plus selenium rectifier.
Frequency Ranges — Tuning drive ratio 12:1
Broadcast — 540-1620 KC
FM — 88-108 MC

Components marked with an * are part of N1, the Audio Circuit Coupler. Condensers "C" plus "D" equal 250 mmf in complete.
Components marked ▲ are part of chassis wiring.

(Continued on the next page)

PHILCO Model E-976 (Continued from the preceding page at left)

AM ALIGNMENT PROCEDURE

OUTPUT INDICATOR — Connect either an a-c voltmeter or an oscilloscope across the voice coil terminals.

SIGNAL GENERATOR — Use an AM r-f signal generator with modulated output.

1. Connect generator, through a .05 mfd condenser, to grid, pin 7, of the AM converter, S-3. Connect ground lead to chassis.
2. Set generator to 455 kc, tuning gang fully closed and adjust, in order given, TC14, TC13, TC12 and TC11 for maximum output. Repeat until no further gain is indicated.
3. Connect generator to radiating loop. Set generator to 1600 kc. Set receiver to 1600 kc as indicated by pointer. Adjust VC-2B for maximum.
4. Set generator to 1400 kc. Tune receiver to signal and adjust VC-2A for maximum.

FM ALIGNMENT PROCEDURE

1. Calibrate the scope for 2 volts P/P.
2. Connect the scope, through a 100,000 ohm isolating resistor, to junction of R12 and C26. Scope ground lead to chassis.
3. Connect the signal generator to bottom of T1 secondary (junction of T1 with R1 and C5). Generator ground lead to chassis.
4. Inject marker signal, 10.7 mc (unmodulated).
5. Inject sweep signal, 10.7 mc, approximately 150 kc total deviation (do not over sweep).
6. Adjust cores TC8, TC7, TC6, TC5, TC4 and TC3

for maximum amplitude, symmetrical curve with the 10.7 mc marker at top of curve.

Adjust input signal to maintain output, as shown on scope, below 2 volts peak during alignment.

Repeat step 6 until no further gain is obtained.

7. Calibrate the scope for 5 volts P/P.
8. Change the scope connections to L10 (FM audio output to function switch).
9. Remove sweep signal. Inject 10.7 mc, 30% AM modulated signal. Adjust TC10 for minimum indication between peaks. See note below.
10. Inject 10.7 mc sweep signal and adjust TC9 for maximum symmetrical output.
11. Touch up cores as in Step 6 plus TC9 for a symmetrical, maximum amplitude, discriminator curve. To check alignment, discriminator curve should not shift in frequency with an increase in signal input (below overload). If a shift does occur, the I-F is not properly aligned, particularly the first stage, TC3 and TC4.
12. Inject 108.5 mc 30% AM modulated signal, through an antenna matching network to the receiver antenna terminals.
13. Open tuning condenser. Insert a 6 mil, non-metallic, shim between stator and rotor of the FM gang and close gang against shim. Adjust VC3 for minimum indication between peaks.
14. With tuning condenser fully closed, inject 87.75 mc, 30% AM modulated, signal and adjust TC2 for minimum indication between peaks. See note below.
15. Inject 91 mc, sweep signal and with tuning gang tuned to 91 mc, adjust TC 1 for maximum output.

IDENTIFICATION OF PRINTED PANEL TIE LUGS

PHILCO PORTABLE RADIO Transistor Model T-7

(For alignment and other service data see the next page adjacent at right)

SERVICE NOTES

When signal tracing, inject signal at transistor collector and limit input to keep signal across speaker below 0.8 volts.
Normally, the transistors should be the last item suspected.

If C15 opens serious audio oscillation will result.
Dress lead from top, center, frame lug of gang to end ground lug is important to reduce beat. See base layout for lead dress.

(Continued from preceding page)

ALIGNMENT PROCEDURE

GENERAL—Allow the test equipment to warm up for fifteen minutes before starting the alignment procedure.

OUTPUT INDICATOR—Connect the output indicator (a 1000-ohm-per-volt, a-c voltmeter, or an oscilloscope) across the voice-coil terminals.

SIGNAL GENERATOR—Use an AM r-f signal generator. Connect the ground lead to chassis, and connect the output lead as indicated in the alignment chart.

OUTPUT LEVEL—Attenuate the signal-generator output throughout the alignment so as to maintain the output level below .8 volt.

RADIO CONTROLS—Set the volume control to maximum. Set the tuning control as indicated in the alignment chart. During alignment of the radio, the batteries should be in the same position with respect to the chassis and the loop antenna as they normally are in the cabinet.

ALIGNMENT CHART

STEP	SIGNAL GENERATOR		RADIO		
	CONNECTION TO RADIO	DIAL SETTING	DIAL SETTING	SPECIAL INSTRUCTIONS	ADJUST
1	Connect signal generator through a .1-uf. condenser to ont. section of gang.	455 kc.	Tuning gang fully open.	Adjust for maximum output in order given.	TC5—3rd i-f pri. TC4—2nd i-f pri. TC3—1st i-f sec. TC2—1st i-f pri.
2	Use radiating loop. (See NOTE 1 below.)	600 kc.	600 kc.	Adjust for maximum output. Rock tuning gang while making this adjustment.	TC1—osc. core
3	Same as step 2.	1620 kc.	1620 kc. (Tuning gang fully open)	Adjust for maximum output.	C1B—osc. trimmer
4	Same as step 2.	1400 kc.	1400 kc.	Adjust for maximum output.	C1A—antenna trimmer
5	Repeat steps 2, 3, and 4 until no further improvement is obtained. Always stop on step 4.				

NOTE 1. Use a 6-to-8-turn, 6-inch-diameter loop made up of insulated wire. Connect to generator terminals, and place about one foot from radio loop.

12		Repeat Steps 9, 10 and 11		
13	Reassemble chassis and antenna in cabinet. Check adjustment of C29 ("B" Ant.) at 4800 kc and C30 ("A" Ant.) at 1400 kc.			

Alignment Procedure

Test Oscillator—For all alignment operations, connect the low side of the test oscillator to the receiver chassis and keep the oscillator output as low as possible to avoid AVC action.

Battery operation of the receiver is preferable during alignment; on AC operation an isolation transformer (117v./117v.) may be necessary if the test oscillator is also AC operated.

Critical Lead Dress

1. Dress all filament leads next to chassis.
2. Use short pigtail leads on components to V1, Pin 6.
3. Dress gang leads direct to avoid excess lead length.
4. Dress capacitor C17 across V3 socket to act as shield for C21.
5. Dress capacitors C3, C4 and C6 down to base between V1 socket and V2 socket, use short leads.
6. Use short pigtail lead on C16 to V3-2 and dress away from Pin 6.
7. Dress capacitor C24 down to base.
8. Twist loop antenna leads and dress into slots provided in cabinet—allow sufficient slack to permit rotation of antenna.
9. The "A" band series ant. coil (L3) and "B" band shunt ant. coil (L2) should be dressed away from chassis.

Dial-Indicator and Drive Mechanism

Chassis Removal

1. Remove control knobs (pull off).
2. Unsolder the two loop antenna leads.
3. Pull out battery and disconnect battery plug.
4. Remove the four chassis mounting screws, two at front sides and two at top rear.

STYLUS REMOVAL

Each stylus is mounted on a short pin which fits into a socket on the pickup. To remove a stylus, pull straight outward away from pickup; it is held in place only by pressure fit.

When replacing a stylus, be certain that the stylus coded with red paint points downward when "33-45" is visible on top of control lever. Likewise, the uncoded stylus should point downward when "78" is visible on top of control lever.

OPERATION

Remove metal Needle Guard from the Tone Arm. Turn POWER-VOLUME knob clockwise about one-half turn. Allow brief warm-up.

Move SPEED CONTROL lever to "33," "45," or "78" position for correct Turntable Speed.

Place record over correct Spindle onto Turntable.

Turn NEEDLE SELECTOR to "33-45" before playing 33 $\frac{1}{3}$ or 45 r.p.m. records; to "78" before playing 78 r.p.m. records.

Set Tone Arm needle at start of record; adjust VOLUME and TONE as desired.

RCA VICTOR

MODEL 8-BT-10K

Chassis No. RC-1156A

It is possible to damage a transistor when testing circuit continuity. Since a transistor needs only low voltage applied to its terminals for conduction, testing continuity of a circuit which includes a transistor can result in misleading continuity indications. To avoid transistor damage and misleading continuity indications, remove the transistor from its socket before making continuity tests of its circuit.

VOLTAGES MEASURED TO CHASSIS WITH VOLTCOMYST SHOULD HOLD WITHIN $\pm 20\%$ WITH 9V. BATTERY.

ALL RESISTANCE VALUES IN OHMS. K=1000

RCA VICTOR

RP-205 Series

Automatic Record Changers

(This service material is presented below and continued on the next twenty-one pages)

Figure 2—Top View of RP-205-2 with Turntable Removed

Other models differ in appearance of pickup arm.

GENERAL DESCRIPTION

The RP-205 Series record changers are four-speed mechanisms designed to play, in automatic sequence, a stack of 7", 10" or 12" records, or 10" and 12" records intermixed. The mechanism will shut off automatically after playing of the last record.

Record separation is accomplished by movement of a finger in the center spindle. This finger directly separates records having a $\frac{1}{4}$ " centerhole and actuates the knives and shelves of the centerpost used for the playing of records having a $1\frac{1}{2}$ " centerhole.

The tripping method used is the acceleration or velocity type in which the trip lever causes a trip pawl to engage a projection on the turntable hub and start the mechanism into cycle. If the record being played causes the pickup arm to move inward at a constant rate without acceleration, a point will be reached where a constant-diameter trip is effected.

A well is provided on the record changer for storage of the centerpost when it is not in use. The centerpost may be firmly secured, after placing it in the well, by pushing down.

Figure 3—Partial Bottom View of RP-205-2 with Cycling Slide Removed

RCA Victor Record Changers RP-205 Series, Continued

ADJUSTMENTS

LANDING ADJUSTMENT (Fig. 4)

When the pickup arm is mounted the clamp screw should seat in the depression in the pickup arm lever shaft, then only one landing adjustment is necessary. The landing position of the stylus is adjusted by means of the slotted nut at the side of the pickup arm support bracket. When adjusted for correct landing on one size record (12" record preferably if convenient), the landing position for the other two sizes is automatically maintained.

Lift and turn the record stabilizer arm outward. Place a 12 inch or 78 rpm record on the turntable. Turn the speed control knob to the 78 rpm position and the control lever to the reject position. Rotate the turntable by hand until the stylus is just ready to set on the record. Then turn the landing adjustment screw so the stylus will set on the record midway between the outer edge and the starting groove.

Slight "touch up" or a compromise in this adjustment may be necessary so that the pickup will land correctly on all three size records when operating automatically.

PICKUP ARM HEIGHT ADJUSTMENT (Fig. 4)

The pickup arm height during cycle is adjusted by means of the hex head screw, located in the pickup arm.

Turn control knob to "REJ" and rotate turntable by hand until arm has risen to its maximum height. Adjust screw so that stylus is $1\frac{3}{8}$ " above turntable.

RECORD DROPPING ADJUSTMENT

The eccentric stud (Ill. No. 101, Fig. 5) on the end of the cycling slide controls the time during cycle at which the record drops to the turntable.

Adjust the position of the stud so that the record drops to the turntable when the pickup arm has moved to its maximum

outward travel. If the record drops too soon it will strike the pickup arm. If timed too late the record may not drop.

10" INDEXING LEVER ADJUSTMENT

The rubber tip (Ill. No. 85, Fig. 2) on the 10" indexing lever is molded onto a threaded shaft and provides a means of adjustment for proper indexing.

Adjust rubber tip so that it will be depressed at mid-cycle approximately $\frac{1}{16}$ " by a 10" or 12" record when the record rests on the turntable. The rubber tip should not touch the record when the mechanism is out of cycle.

Figure 4—Pickup Arm Height and Landing Adjustments

Figure 5—Bottom View of Mechanism RP-205-2

RP-205-1, RP-205-3 and RP-205-4 use a larger motor (4 pole) and a different speed control rod (item 33).
RP-205A-1 and RP-205A-2 use a voltage change switch.

RCA Victor Record Changers RP-205 Series, Continued

CYCLE OF OPERATION

NOTE: In the cycle of operation it is assumed the mechanism has stopped automatically with the pickup arm on the rest.

PRELIMINARY PROCEDURE

Place a stack of records (10" or 12") on the spindle (intermixed if so desired). Place the record stabilizer arm so it rest on the records.

OR

If playing 7 inch records first place the large centerpost over the regular spindle, then proceed as for large records.

MANUAL START

Push control lever (20) in a clockwise direction to the "On" position. This movement of the control lever through the linkage of levers (30, 80, 79 and 21B) results in actuating the power switch (64) and the motor starts running. Then push control lever further clockwise to "Rej." position and permit it to return to the "ON" position automatically.

This movement of the control lever to the "Rej." position transmits a force from lever (21B) through wire (11) to lever (21A). The lever (21A) then contacts and applies force against turned up lance (89A) of trip slide (89) and pushes the trip slide in an outward direction away from the turntable spindle.

Tab (89B) of trip slide makes a contact with trip pawl (87E) thereby moving engagement pawl (87F) into position where it is in the path of the projection on the turntable hub. As the turntable rotates, the projection on its hub momentarily strikes the engagement pawl (87F) causing the cycling gear (87) to rotate sufficiently so that the cycling gear teeth and those of the hub (6A) will mesh.

CYCLING STARTS

As the cycling gear (87) rotates, the stud (87G), which is mounted on the bottom of the gear and extends through and rides in the elongated slot in the cycling slide (92), pushes the slide outward away from the spindle.

PICKUP ARM RISES AND MOVES OUT

Almost immediately after the slide starts on its outward movement the pickup arm lift rod (72) rides up the inclined portion of the lance (92A) forcing the lift rod upward against the height adjustment stud (14) causing the pickup arm to rise.

About this same time the cycling gear has rotated sufficiently for the trip pawl to slide over the edge of a small piece of metal extending from the bottom of the motor board and resets itself to prevent the mechanism from tripping continuously.

RCA Victor Record Changers RP-205 Series, Continued

CYCLE OF OPERATION (Cont.)

PICKUP ARM RISES AND MOVES OUT (Cont.)

Further movement of the slide (92) results in a contact between the straight spring wire (93) attached to the slide) and the bottom stud (71A) on the pickup arm lever (71) thereby rotating the lever and starting the pickup arm on its outward movement. At this time the upper stud (71B) slides over latch (68A) and locks the pickup arm return lever (68) to the pickup arm lever (71). This locked condition causes both the pickup arm lever and the pickup arm return lever to rotate as a unit in opposition to the force applied by the pickup arm return spring (66). Since the pickup arm is connected to the pickup arm lever through the pickup arm shaft, the pickup arm follows.

While the pickup arm lever and the pickup arm return lever are latching together, and the cycling slide is approaching the end of its outward travel the stud (92B) (mounted on cycling slide) contacts actuating lever (38) and unlatches (21C). It is important at this time to realize that the unlatching of (21C) is necessary for pickup to land on the record, it would otherwise land in the rest position.

As the slide reaches the extreme end of its outward travel (mid cycle position) the pickup arm lever (71) is pushed to a position where one end of the lever is against the stud (extending from the bottom side of the motor board) while the stud on the other end of the lever remains against the wire takeup spring (93).

The pickup arm lever (71) held in this wedged position (when the pickup arm is in its outermost position) produces a positive stabilizing action for the pickup arm as the record drops to the turntable. However, to prevent erratic landing, it is necessary that latch (68A) remains latched so that pickup arm lever and pickup return arm lever remain coupled together as the pickup moves in for landing.

RECORD DROPS TO TURNTABLE

Just before slide (92) reaches its maximum travel outward, the eccentric stud (101) (mounted on the under side of the slide) contacts and pushes spindle operating arm (45).

The lower end of the push-off finger, extending through the hole in the operating arm, rides along with the arm. Since the push-off finger is pivoted about a pin driven through the spindle, the upper end of the finger moves in a direction to push the record off the shelf of the spindle and the record drops to the turntable. The retainer (10A) effects record separation by blocking the adjacent record, thereby preventing it from being pushed off the shelf of the spindle. After the record drops to the turntable (mid-cycle position) the cycling slide (92) starts on its return trip to the normal out-of-cycle position.

THE PICKUP LANDS ON RECORD

During the return travel of the cycling slide the wire spring (93) (attached to the slide) moves away from the stud (71A) (on the pickup arm lever) permitting the pickup arm lever and the pickup arm return lever (which are locked together) to direct the movement of the pickup arm inward.

The pickup arm is pushed inward by the pickup arm return lever, until the pickup arm return lever is blocked by the landing selector lever (83) which contacts one of three steps formed in the return lever. Each step corresponds to one of the three (7, 10 or 12 inch records) landing positions.

RCA Victor Record Changers RP-205 Series, Continued

CYCLE OF OPERATION (Cont.)

THE PICKUP LANDS ON RECORD (Cont.)

As the pickup arm return lever directs the movement of the pickup arm, the stud (68B) on the pickup arm return lever moves away and permits the spring (73) to raise the end (74A) (of switch link shut-off assembly) so as to clear the escape lever (92D). Otherwise the mechanism would actuate switch (64) and motor would stop.

When the pickup is directly above the landing position the cycling slide has returned sufficiently for the pickup arm lift rod to ride down the inclined portion of the lance in the slide and the pickup stylus rests on the start of the record.

An instant before the pickup sets on the record, the stud (92B) located on the extreme end of the cycling slide contacts the end of the actuating lever (69), unlatching the pickup arm lever from the pickup arm return lever. This allows the pickup arm to become free in its movement at the time the stylus contacts the record. At this time the cycling cam has not quite completed its return travel.

The remaining short travel results in the stud (92B) carrying the actuating lever (69) sufficiently that the pickup arm return lever is pulled away from the landing selector lever (83). The stud (68B) on pickup arm return lever (68) is then latched to pickup arm latch (21C) and remains latched throughout the playing cycle.

CYCLING COMPLETED

As the cycling gear is completing its cycle, a stud (87H) located on the top of the cycling gear contacts and pulls the trip slide (89) back to the position for the next tripping.

The final phase of the change cycle is completed after the cycling gear has rotated sufficiently so that the teeth in the gear on the turntable hub run off the last tooth at the cut-away section of the gear. At this time the stud (87G) riding in the elongated slot in the cycling slide, drops into the stop notch and the cycling gear stops rotating.

The muting switch is opened at this time by a tab on the cycling slide.

RCA Victor Record Changers RP-205 Series, Continued

CYCLE OF OPERATION (Cont.)

RECORD PLAYS

As the record plays and the pickup moves inward, the pickup arm lever (71) contacts trip slide (89) and pushes the slide outward away from the center post. The other end of the trip slide contacts and moves trip pawl which, through a friction clutch arrangement, moves trip engagement pawl.

While the record continues to play the pickup moves in at a constant rate of speed until the sloped side of the engagement pawl lightly contacts the projection on the turntable hub. When this contact occurs the engagement pawl is pushed back with each rotation of the turntable, providing the pawl has not moved in so far that the contact is made on the leading edge. If the inward movement of the pickup should accelerate rapidly, as it does when the stylus leaves the recorded section and enters the eccentric groove of the record, the trip engagement pawl moves in too far before the turntable has made a complete revolution; consequently the projection on the turntable hub makes contact on the side of the engagement pawl. This firm contact rotates the cycling cam sufficiently to have the teeth of the turntable hub and the cycling gear engage to start a change cycle. This tripping procedure is referred to as an acceleration trip. However if the pickup continues to move inward at a constant rate, there is a limit at which the edge of the engagement pawl will make a firm contact with the projection on the turntable hub and a constant diameter trip is effected.

As the cycling cam is carrying the mechanism through cycle a tab on the bottom of the motorboard will contact and reset the trip pawl mechanism so the changer will not recycle without playing the next record.

INDEXING FOR PICKUP LANDING POSITION

As stated previously the pickup landing position for 7, 10 and 12 inch records is determined by the contact of the landing selector lever (83) and the various steps in the pickup arm return lever.

There are two depressions (lances) in the cycling cam that play an important function in pickup landing position indexing. The depression located adjacent to the trip pawl mechanism provides a means of indexing for 7" records. This is accomplished by permitting the end of the 10" indexing lever (84) to drop down in the depression as the cam rotates causing the other end to push the landing selector lever (83) upward as far as it will go. The pickup arm return lever will then make contact with the landing selector lever (83) on the upper step and the pickup will land on the start of a 7" record.

RCA Victor Record Changers RP-205 Series, Continued

CYCLE OF OPERATION (Cont.)

INDEXING FOR PICKUP LANDING POSITION (Cont.)

When either a 10" or a 12" record is lying on the turntable the rubber end of the 10" indexing lever (84) is prevented from rising even though the other end of the lever tends to drop into the depression in the cam. Consequently the landing selector lever is only pushed up far enough, that the pickup arm return lever makes contact with the second step and the pickup will land on a 10" record.

However if a 12" record drops to the turntable the edge of the record strikes the 12" indexing lever (41) and causes the other end of the lever to rotate the selecting lever (65) sufficiently to permit landing selector lever (83) to drop off the tab (65A) and land on tab (65B). With the landing selecting lever in this position, it will make contact with the lower step in the pickup arm return lever stopping the pickup arm on its inward movement, so the pickup will then land on the start of a 12" record.

The other depression (lance) opposite the trip pawl mechanism provides a means of raising the end of the indexing selector (83) to the top of the tab (65A) so the landing is automatically returned to the 10" landing position. This means of automatically returning the pickup landing to 10" position makes it possible to play 10" and 12" records intermixed.

STARTING PROCEDURE OF "LAST-RECORD-STOP"

The stabilizer arm not only performs the function of stabilizing the records setting on the spindle shelf but it also serves the purpose of actuating the automatic stopping feature.

As the last record of the stack drops to the turntable the record stabilizer arm (1) drops and actuates the stop lever (55). This stop arm in turn applies force to the stop lever (21D) through spring (57), lever 58 and connecting wire (60). At this moment the cycling slide has reached its outermost position and the end (21D) is pushing upward on escape lever (38) but is held from doing so by the knobbed end on the stud 92B which retards the movement of the escape lever (38) until the cycling slide has started on its return trip.

The escape lever then raises and the pickup lands and plays the last record.

CONTROLS

The record changer is provided with a dual control located in the right hand corner of the motor board and a stylus selector control located on the pickup arm.

The outer portion of the dual control provides a means of controlling the operation of the mechanism while the inner control governs the turntable speed.

By turning the outer control to the "ON" position, the turntable starts rotating. By turning the control one step further in a clockwise direction to the "REJ" position and permitting the knob to return to the "ON" position, the complete automatic operation of the mechanism is started.

The mechanism will stop automatically after the last record has been played but if desired, can be stopped by turning the control counter-clockwise to the "OFF" position and placing the pickup on the rest.

The inner or motor speed control makes possible the selection of one of four speeds, by rotating the knob to the proper position.

The speed control should be turned to the "N" position (midway between "45" and "78") to remove the force of the motor shaft against the idler wheel when the changer is not expected to be used for an extended period of time.

The stylus control for models using the ceramic pickup (#100653) has two positions. One position with the control lever to the right ("78" showing) selects the .003" stylus for

78 r.p.m. records, with the lever to the left ("MG" showing) the .001" stylus is selected for 16 $\frac{2}{3}$, 33 $\frac{1}{3}$ and 45 r.p.m. records.

The stylus control for the variable reluctance pickup used with Model RP-205-3 has two positions (right and left). The arrow on the knob points to the stylus in use.

Two plug-in heads are supplied for use with Model RP-205-1. The head in use is secured to the pickup arm by a thumbscrew on the underside of the arm. One head is equipped with a .001" diamond stylus and is used for playing 16 $\frac{2}{3}$ r.p.m., 33 $\frac{1}{3}$ r.p.m. or 45 r.p.m. records. The other head is equipped with a .003" synthetic sapphire stylus and is used for playing 78 r.p.m. records only.

The removable centerpost is for use with 16 $\frac{2}{3}$ or 45 r.p.m. records having the large centerhole. It must be placed over the center spindle with the word "FRONT" FACING to the FRONT. Care should be exercised in placing and removing centerpost so as to prevent damage to smaller spindle.

A well is provided on the motorboard for storage of the centerpost when not in use. The centerpost may be firmly secured, after placing it in the well, by pushing down until a slight "click" is heard. It may be necessary to twist slightly while pushing down. To remove centerpost from well, twist slightly until centerpost "pops up".

To load or remove records, lift and turn the record stabilizer arm off to the side. After loading, the stabilizer arm should be turned to the center so it rests on the stack of records.

Figure 8—Controls (Ceramic Pickup)

Figure 8A—Moving Coil Pickup

Figure 8B—Variable Reluctance Pickup

STYLUS REPLACEMENT

CERAMIC PICKUP #100653

The dual stylus used in this pickup is held in position by a spring clamp. To remove styli simply lift spring clamp and stylus will drop out. When inserting new stylus make certain the wire bridge holding the stylus assembly is engaging the drive arm to the cartridge element.

VARIABLE RELUCTANCE PICKUP MI-12110-A and MI-12112-A

The dual stylus assembly is held in position by a "C" ring retainer. Remove "C" ring, spring and washer; then push stylus through the cartridge.

The two styli mounted on the stylus assembly are of the "clip-in" type and may be individually replaced.

MOVING COIL PICKUPS #102955 and #102956

The styli used in these pickups are not designed for field replacement.

OPERATION OF
16 $\frac{2}{3}$ —45 R.P.M. CENTERPOST

In the out-of-cycle position (playing), the records with $1\frac{1}{2}$ " centerhole rest upon the protruding shelves of the centerpost (knives are retracted).

When the mechanism goes through cycle, the record push-off finger in the $\frac{1}{4}$ " center spindle pushes against the actuator slide. This slide actuates two pairs of pivot levers. One pair of these levers pull the shelves inward (downward projections of pivot levers extend through long slots of knives and engage in short slots of the shelves). The other pair of levers push the separator knives outward (downward projections of pivot levers engage small holes in knives—long slot of shelves allow freedom of movement).

Two small coil springs push outward on the shelves and thus return them to the normal outward position. A formed metal spring extending up into the nose cap returns the slide to its normal position.

In the normal position the stack of records is supported by the shelves. During cycle the separator knives are extended first and then the shelves are retracted. The knives extend into the opening between the bottom record and the one adjacent; thus supporting all but the bottom record. When the shelves retract the bottom record falls to the turntable.

Careless placement or removal of the centerpost on the center spindle may result in bending of the center spindle. The centerpost should be placed on or removed from the center spindle with a STRAIGHT VERTICAL MOTION. The word "FRONT" should always face to the front of the record changer.

46	78711	Spring—Return spring for spindle operating arm
49	78657	Lever—Spindle reset lever
50	78694	Pin—Pivot pin for spindle reset lever
51	78661	Washer—"C" type retaining ring for pivot pin Ill. #50 (2 req'd)
52	78745	Spring—Actuating spring for reset lever
53	33726	Washer—"C" type retaining washer (.406" O.D. x .125" I.D.) (3 req'd)
53A	75749	Washer—Flat washer for motor mounting (3 req'd)
54	33136	Grommet—Rubber grommet for motor speed selector rod
55	78674	Lever—Shut-off lever assembly
56		Screw—#8 x 3/8" hex head S.T. screw for shut-off lever assembly Ill. #55
57	78681	Spring—Shut-off lever spring
58	78675	Arm—Transfer arm for shut-off mechanism
59	78714	Spring—Return spring for transfer arm
60	78679	Wire—Shut-off wire
61	35969	Washer—"C" type retaining washer for transfer arm Ill. #58 (.500" O.D. x .183" I.D.)
62	78676	Switch—Muting switch assembly
63		Screw—H.H.S.T. #8 x 3/8" screw for muting switch
64	76301	Switch—"On-Off" switch—SPST.
65	78661	Lever—Landing selector lever
66	78713	Spring—Return spring for pickup arm return lever
67	78699	Spring—Return spring for pickup arm return lever actuating lever
68	78655	Lever—Pickup arm return lever assembly
69	78724	Lever—Actuating lever assembly for pickup arm return
70	78653	Ring—Retaining ring for pickup arm return actuating lever Ill. #69

ILL. NO.	STOCK NO.	DESCRIPTION
71	79091	Lever—Pickup arm lever
72	78672	Rod—Pickup arm lift rod
73	78699	Spring—Return spring for switch shut-off link
74	78695	Link—Switch shut-off link assembly
75	78651	Washer—"C" type retaining washer for switch shut-off link bracket Ill. #76
76	78664	Bracket—Switch shut-off link bracket
77		Nut—#6-32 nut for mtg. switch shut-off link bracket Ill. #76 (2 req'd)
78	78710	Spring—Return spring for switch and reject lever
79	102529	Lever—Reject & switch control pivot lever with studs
80	102532	Link—Control link for "On-Off-Rej."
81	100157	Washer—Flat washer for mounting trip slide lever Ill. #89
82	35969	Washer—"C" type retaining washer for reject control pivot lever Ill. #79
83	78689	Lever—Landing selector lever
84	78690	Lever—Index lever for 10" records—with adjustable cushion
86	100913	Cushion—Rubber cushion & screw assembly for index lever (Ill. #84)
86	78721	Washer—Flat washer for landing control bearing pin Ill. #13 (3 req'd)
87	78691	Gear—Cycling gear—less pawl levers
87A	78651	Washer—"C" type retaining washer
87B	79240	Washer—Flat washer for trip pawl pressure spring
87C	78727	Spring—Trip pawl pressure spring
87D	78725	Lever—Trip pawl actuating lever
87E	78726	Lever—Trip pawl intermediate lever
86	35969	Washer—"C" type retaining washer for spindle mounting bracket Ill. #43 (.500" O.D. x .183" I.D.)
89	78688	Lever—Trip slide lever
90	78719	Washer—Flat washer for mounting trip slide lever Ill. #89
91	33726	Washer—"C" type retaining washer for trip slide lever Ill. #89 (2 req'd) (.406" O.D. x .125" I.D.)
92	79794	Slide—Cycling slide assembly
93		Wire—Steel wire for slide (.059" dia. x 2 1/4")
94	75749	Washer—Flat washer for slide assembly (79794) (2 req'd)
95	33726	Washer—"C" type retaining washer (.406" O.D. x .125" I.D.) (2 req'd)
96	78705	Spring—Actuating spring for escape shut-off lever (Part of Ill. #92)
97		Washer—#6 flat washer (3 req'd) for slide mounting
98		Lockwasher—Ext. #6 for slide mounting (7 req'd)
99		Screw—H.H. #6-32 x 5/16" screw for slide mounting (2 req'd)
100	74431	Washer—Spring retaining washer for eccentric stud (Part of Ill. #92)
101	78685	Stud—Eccentric stud for drop adjustment (Part of Ill. #92)
102	79352	Spring—Formed wire spring for slide assembly
103	100735	Support—Spindle bearing support
104		Screw—#6-32 x 5/16" screw for mounting support Ill. #103
105	78653	Ring—Retaining ring for landing selecting lever Ill. #65
106	77586	Washer—"C" type retaining washer for link Ill. #74
107	100987	Spring—Tension spring for pickup arm latch actuating lever Ill. #36
108	100986	Plate—Spacer plate under switch shut-off link bracket Ill. #76
		MISCELLANEOUS
	74545	Cable—Shielded audio cable (66 in.) with pin plug—for RP-205-3 and RP-205-4
	73805	Capacitor—Fixed, paper, .0047 mf. ±20%, 1000 v.—for RP-205A-1 and RP-205A-2
	79149	Capacitor—Fixed, paper, 0.1 mf. ±20%, 600 v. (part of click filter)—for RP-205-1, RP-205-3 and RP-205-4

Figure 16—Pickup & Arm Assembly for RP-205-1, RP-205-3 and RP-205-4

RCA Victor Record Changers RP-205 Series, Continued

REMOVAL OF TURNTABLE

The turntable retaining ring (Illust. #7) must be removed before the turntable can be lifted off. Special pliers to remove this type of ring are made by Waldes-Kohinoor, Inc. 47-16 Austel Place, Long Island City, New York.

If the special tool is not available, the retaining ring can be easily removed by using two pointed tools such as awls or ice picks.

When replacing the turntable, it will be necessary to push inward on the idler wheel, that contacts turntable rim, before the turntable will lower to original position. This is best done by pushing with a piece of cardboard or a thin wood stick. Turn the turntable clockwise after idler wheel is pushed inward.

SELECTION OF OPERATING VOLTAGE
(RP-205A-1, RP-205A-2)

Remove the turntable as described above, move the VOLTAGE CHANGE SWITCH to "117" for 105-125 volts or "234"

for 210-250 volts to correspond with the available power supply. Replace the turntable using the procedure outlined above.

50 60-CYCLE CONVERSION

Remove the turntable as described above, remove SPRING SLEEVE from motor driveshaft and replace with the specified SPRING SLEEVE for the frequency of the available power supply. Hold motor driveshaft stationary and turn SPRING SLEEVE clockwise when installing. Use care to prevent distortion of spring or damage to motor driveshaft. Replace the turntable using the procedure outlined above.

NOTES.—Motors stamped 936173-1 190 are not recommended for 50-cycle operation.

The 4-pole motor (stamped 971584-1) used on RP-205-1, RP-205-3 and RP-205-4, require a change in the solid sleeve pulley (used for 78, 45 and 33 $\frac{1}{3}$ r.p.m.) in addition to the change of the spring sleeve (used for 16 $\frac{2}{3}$ r.p.m.). In addition, a 60 ohm resistor is used in series with the windings of these motors when converted for operation on 50 cycles.

Figure 17—Turntable Removal, Selection of Operating Voltage and 50/60 Cycle Conversion

Figure 18—Wiring Diagram for Dual-Voltage Motors

STYLUS FORCE

The stylus force used with #100653 ceramic pickup is 7 to 9 grams. This pickup is used on RP-205-2, RP-205-4, RP-205-6, RP-205A-1 and RP-205A-2.

The stylus force used with variable reluctance pickups MI-12110-A and MI-12112-A is 7 to 9 grams. These pickups are designed for use on RP-205-3.

The stylus force used with moving coil pickup #102956

(1-mil stylus) is 6 to 8 grams. The stylus force used with moving coil pickup #102955 (3-mil stylus) is 10 to 14 grams. The 3-mil pickup head assembly contains a lead weight to attain the desired stylus force. These pickups are used on RP-205-1.

No provision is made for field adjustment of stylus force. The counterbalance spring to be used on a particular model of record changer is selected to give the desired stylus force.

RAYTHEON MANUFACTURING COMPANY

6RT1 CHASSIS

MODELS: T-150-1, T-150-2, T-150-3, T-150-4, & T-150-5

R17 changed from 4700 ohm to 3900 ohm, 1/4 watt, 10%.

BATTERY REPLACEMENT

The battery should be the first component checked when the radio is presented for service, since the battery voltage decreases with use and age. The battery voltage should be checked at the battery cable connections with the receiver turned on, and after at least five minutes of operation. Batteries have a tendency to reactivate (re-charge) when not in use, and a true test of the batteries capabilities can not be determined until sufficient current has been drawn from the battery. If the battery is found to be dead, the receiver should be checked for a short circuit before the replacement battery is installed. Disconnect battery and measure resistance with an ohmmeter at the battery cable connections. Ohmmeter will indicate approximately 2100 ohms with positive lead to chassis, approximately 170 ohms with negative lead to chassis and approximately 3200 ohms with all transistors out of circuit with either meter lead to chassis. Battery replacement should be performed when the sound output is noticed to be muffled or distorted with a decrease in total output.

NOTES

RESISTOR VALUES ARE IN OHMS, 1/4 WATT, 10% TOLERANCE, UNLESS OTHERWISE SHOWN

CAPACITOR VALUES ARE IN MICRO-MICROFARADS. UNLESS OTHERWISE SHOWN DC WORKING VOLTAGE IS 25V UNLESS OTHERWISE SHOWN. DC VOLTAGE READINGS TAKEN WITH VTVM, NO SIGNAL IN INPUT AND BATTERY VOLTAGE - 9VDC. VOLTAGES WILL VARY WITH TRANSISTOR CHANGES. ALL VOLTAGES ARE NEGATIVE.

OHMMETER READINGS

When using an ohmmeter to check continuity and resistance readings, caution must be observed. It is important to know the internal battery voltage of the ohmmeter as damage could result due to excessive voltage being applied to the circuit by the ohmmeter.

RAYTHEON MANUFACTURING COMPANY

7RT4 CHASSIS

MODEL T-2500

SPECIFICATIONS

Power Supply	6 volts D.C.
Frequency Range	540 to 1600 KC.
Intermediate Frequency	455 KC.
Selectivity	At 1000 KC, 52. KC at 1000 x signal
Sensitivity	200 u.v. per meter
Power Output	100 m. w.
Speakers	(Dual) 5 1/4" P.M., v.c. Impedance 8 ohms.

If a transistor is suspected of being defective, substitution will be the only reliable check. Note that sockets are provided for the converter and oscillator transistors while the remaining transistors are soldered in place.

UNLESS OTHERWISE SHOWN, RESISTOR VALUES ARE IN OHMS AND 1/2 WATT.
CAPACITOR VALUES ARE IN MICRO-MICROFARADS UNLESS OTHERWISE SHOWN.
DC VOLTAGE READINGS TAKEN WITH VTVM, NO SIGNAL INPUT AND BATTERY VOLTAGE -6VDC. VOLTAGES WILL VARY WITH TRANSISTOR CHANGES.

SYLVANIA Chassis 1-607-5, -6, Models 2101, 2202

VOLTAGE AND RESISTANCE MEASUREMENT CONDITIONS UNLESS OTHERWISE SPECIFIED:

1. VOLTAGES MEASURED TO NEGATIVE "B". ALL VOLTAGE AND RESISTANCE READINGS TAKEN WITH A SYLVANIA VACUUM TUBE VOLTMETER.
2. POWER SOURCE 117 VOLTS 60 CYCLE AC
3. LOOP ANTENNA AND SPEAKER CONNECTED TO CHASSIS.
4. TUNING CAPACITOR PLATES SET TO FULLY CLOSED POSITION. VOLUME CONTROL SET TO MINIMUM.
5. VOLTAGE AND RESISTANCE VALUES SHOWN ARE AVERAGE READINGS. VARIATIONS MAY BE NOTED DUE TO NORMAL PRODUCTION TOLERANCES.
6. VOLTAGE AND RESISTANCE READINGS ARE NOT SHOWN WHERE TOO SMALL.
7. VOLTAGE READINGS MARKED " * " ARE WIDELY VARIABLE, DEPENDENT UPON SIGNAL CONDITIONS.

SYLVANIA
RADIO & TELEVISION

CHASSIS: 1-612-2

MODELS: 3202-3304-3303 SERIES

These two models are almost identical electrically. The circuit of Model 55C42 shown below will also apply to 55C46. Separate tube and trimmer location diagrams are shown. Alignment procedure is identical for both models.

No further adjustment should be necessary as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

Remove the chassis from the cabinet for alignment. A signal generator is required having the following frequencies: 455 KC, 540 KC, 600 KC, 1400 KC, 1610 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the RF. section of the gang condenser through a .1 MFD. condenser. The ground lead from the generator must be connected to "B" minus under the chassis. Turn the gang condenser to complete minimum capacity. Set the generator to 455 KC. Adjust the movable iron cores in the IF cans. The IF adjustments are made in the top and in the bottom of the cans. Adjust the cores until a maximum reading is noted on the output meter.

The volume control of the receiver should be turned to maximum during the IF and all subsequent alignment and the generator output as low as possible to prevent the AVC from working and giving false readings.

SECOND STEP: With the leads from the generator still connected as in IF alignment, adjust the generator to 1610 KC. Make sure that the gang condenser is turned to complete minimum capacity. Adjust the oscillator trimmer of the receiver until the signal is tuned in. Next, turn the gang condenser to complete maximum capacity. Adjust the generator to 540 KC., then adjust the iron core in the end

of the oscillator coil until the signal is tuned in. It may be well to recheck the 1610 KC. setting to make sure that the adjustment of the iron core has not shifted the frequency.

THIRD STEP: Remove the hot lead of the generator from the RF. section of the gang and connect this lead to the ANT. section of the gang. Set the generator to 1400 KC. Turn the gang condenser and tune in the signal. Adjust the RF. trimmer for maximum signal. Set the generator to 600 KC. and turn the gang condenser until the signal is tuned in. Adjust the iron core in the top of the RF. can until a maximum signal is noted. It may be well to re-check the 1400 KC. setting to make sure that the 600 KC. adjustment has not effected the 1400 KC. setting.

FOURTH STEP: Remove the generator leads from the gang condenser and the chassis. Loosely couple the generator to the antenna by laying the hot generator lead near the loop antenna. Set the generator at 1400 KC. and tune in the 1400 KC. signal on the receiver. Adjust the ANT. trimmer and RF. trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary as the coils and gang condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

UNITED MOTORS Chevrolet Model 987573

(Continued on page 156, over)

UNITED MOTORS

(Continued on page 158, over)

Chevrolet Pushbutton Model 987575

Signal trace, using isolated (capacitor in lead) signal tracer." A strong audio signal injected at the 12K5 tube plate, pin #7, should be heard in the case of a dead radio. (A quick check of the audio stage can be made with the radio warmed up by pulling out the 12K5 tube and listening for a "click". If the "click" is heard the transistor stage is working).

(Continued on page 158)

RADIO BLOWS FLÛSES

If the radio blows fuses, check for a shorted transistor.
If the transistor is O.K., check for a short in the radio "A" supply circuit.

UNITED MOTORS Chevrolet 987575 (Continued from page 157)

TROUBLE SHOOTING THE OUTPUT STAGE

A quick way to determine that the 2N173 is conducting can be made by checking the collector voltage, from transistor case to the radio case. If no voltage is present the transistor is not conducting or the transistor heat radiator is grounded to the radio case. If the voltage at the collector is higher than listed the transistor is conducting too heavily (check with milliammeter) or the output transformer is open. The amount of current the transistor conducts is determined by the voltages at each element, the resistor in the base and emitter circuits, the input transformer secondary resistance, and the transistor itself. The most common defect in the transistor is an internal

short between emitter and collector. To check for this, use the following procedure:

1. Unsolder base and emitter leads from the circuit.
2. Set ohmmeter on the "R x 1" scale (no other scale should be used).
3. Place negative lead of ohmmeter (polarity refers to internal ohmmeter battery) on collector, and positive lead on the emitter.
4. The transistor is shorted if reading is "0".

If a transistor is replaced, the "bias" adjustment should be made for the new transistor. Insert a milliammeter in the collector lead and adjust the bias control for a collector current of 930 ma.

PARTS LAYOUT—TUBE VIEW

ALIGNMENT PROCEDURE

Steps	Series Capacitor or Dummy Antenna	Connect Signal Generator to	Signal Generator Frequency	Tune Receiver to	Adjust in Sequence For Max. Output
1	0.1 Mfd.	12AD6 Grid (Pin #7)	262 KC	High Frequency Stop	A, B, C, D
2	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	*E, F, G
3	0.000068 Mfd.	Antenna Connector	640 KC	Signal Generator Signal	J, K
4	0.000068 Mfd.	Antenna Connector	1615 KC	High Frequency Stop	F, G
5	0.000068 Mfd.	Antenna Connector	900 KC	Signal Generator Signal	L**

*Before making this adjustment check mechanical setting of oscillator core "H." The rear of the core should be 1 1/2" from the mounting end of the coil form. (This measurement is readily made by inserting a suitable plug in the mounting end of the coil form.) Core adjustment should be made with a non-metallic screw driver.

**L is the pointer adjustment which is on the connecting link, between the pointer assembly and core guide bar.

It should be adjusted so that when looking directly at the dial the pointer is on the 1100 KC mark. This setting is to give the correct relationship between the pointer and the dial when the radio is installed in a car.

With the radio installed and the car antenna plugged in adjust the antenna trimmer "G" for maximum volume with the radio tuned to a weak station between 600 and 1000 KC (see sticker on case.)

ANTENNA TRIMMER COMPENSATION—For Antennas Between 0.000050 - 0.000090 Mfd.

TUNING RANGE—540-1600 KC.

PUSH BUTTON SETUP PROCEDURE

Pull Push Button to the left and out. Tune in desired station manually. Push button all the way in.

Using Chassis Assembly V-2239-2

ALIGNMENT

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to weakest useable signal level.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial	Connect V.T.V.M. Across Voice Coil and Adjust for Maximum Output —
1	Stator of ant. tuning capacitor (A) through a 200 mmf capacitor	455 kc.	minimum capacity	Top and bottom slugs of T2 and T1 in order given
2	Radiated signal	1625 kc.	minimum capacity	Oscillator trimmer (D)
3	Radiated signal	1400 kc.	1400 kc.	Antenna trimmer (B)

NOTE:
1. ALL CAPACITANCE VALUES IN MFD AND ALL RESISTANCE VALUES IN OHMS UNLESS OTHERWISE STATED.
2. ALL VOLTAGES MEASURED FROM B — USING A V.T.V.M. LINE VOLTAGE SET AT 117 V.A.C. READINGS SHOULD BE AS SHOWN $\pm 20\%$.
3. CHASSIS GROUND $\frac{1}{2}$ COMMON B — $\frac{1}{2}$

Printed Board Servicing

To remove defective parts, apply the tip of the soldering iron to the connection. Keep the soldering iron on the connection just long enough to melt the solder, then quickly brush away solder with a small glue brush. After solder has been removed, separate connections. If the component has bent prongs, such as IF transformers, coils, tube sockets etc., straighten the prongs and cut as close to the board as possible, then heat connection and brush away all solder with small glue brush.

For quick replacement of parts, such as resistors, capacitors etc., the original solder joint need not be touched. If the leads of the defective part are long enough, the defective part may be removed by clipping the leads near the body of the defective component. The new part can be soldered to the connecting wires removed from the original part.

The printed board is held secure in the cabinet by a top and bottom channel molded into the cabinet. Located above the tuning shaft and concealed by the tuning knob is a single screw (No. 6/32-5/8") which mounts the printed board to the front of the cabinet.

To remove the printed board from the cabinet, remove the front control knobs then remove the screw mounting the printed board to the front of the cabinet. Remove the two self-tapping screws, interlock and back cover. The printed board can now be removed from the cabinet.

Top View Ports Layout

BOARD REMOVAL

1. Remove the screw located in center of the tuning knob. Turn the dial to the high frequency end and grip the tuning knob with one hand. Remove the screw by turning it in a counter clockwise direction. Do not cause any undue strain on the tuning capacitor.
2. Remove back of cabinet by loosening coin-slot screw on back. Remove the 1/4" self tapping screw located at tuning condenser end of board.

3. Hold radio in the palm of the hand with the open back side up. Grip the board with the other hand and slide it down towards the tuning capacitor end of the cabinet, until the upper end of the speaker bracket is free of the plastic lip. Now raise this end of the board over lip and slide it out of the cabinet.
4. To insert the board into the cabinet use the reverse procedure, being careful to lock the speaker bracket under both recesses provided in the cabinet front.

602P7

CHASSIS REMOVAL FOR SERVICING

1. Remove the front control knobs.
2. Open the back cover.
3. Unclip the battery cable assembly from the two nine volt batteries and remove the batteries.
4. Remove the two 1/4" self tapping screws which secure the printed board to the cabinet.
5. The printed board can now be removed from the cabinet. Use care and watch to see that the oscillator coil and antenna loop do not touch the printed board mounting bracket located on either side of cabinet. The tuning capacitor, C1, should be in a fully closed position.

H-619P7, -A, Chassis V-2278-3

IF ALIGNMENT REQUIREMENTS

1. Form a 4 or 5 turn loop of wire and connect across the signal generator output cable.
2. Signal generator capable of covering frequencies of 455 KC and the entire broadcast band with provisions for modulation.
3. VTVM or output meter.
4. Keep the output of the signal generator low enough just to give an indication on the VTVM or output meter. If the peak is broad or double peak occurs when rocking the IF slug adjustment, the signal generator output is excessive. Either further decoupling of the generator loop or decreasing the generator output is necessary.
5. Set the volume control and tuning capacitor to maximum.

Loosely couple signal modulated from the generator to:	Loop L301
Generator Frequency	455 KC
Connect VTVM or output meter across the voice coil and adjust:	T303, T302 and T301 in order indicated for max. output (Reduce generator output if necessary for T302 and T301 adjustments. *)

RF ALIGNMENT REQUIREMENTS

Loosely couple modulated signal, from generator to:	C301 Setting	Connect VTVM or output meter across voice coil and adjust for max. output
Loop L301	1625 KC	Oscillator Trim "D"
" "	1400 KC	Antenna Trim "B"

*1† is recommended that a fiber aligning tool that snugly fits the slot in the ferrite core be used to prevent chipping of the slot.

NOTE :

1. DURING SERVING, TOTAL BATTERY CURRENT SHOULD BE METTED. TOTAL BATTERY i_{Bm} SHOULD BE APPROX. 6.5 A.
2. VOLTAGE MEASUREMENTS MADE WITH A V.T.V.M. FROM POINTS INDICATED TC GND. WITH BATTERY SOURCE AT 9 VOLTS.
3. AUDIO OUTPUT TRANSISTORS 2N185 MUST BE MATCHED PAIRS.
4. ALL CAPACITORS ARE 1/2 WATT, 50V. RESISTORS ARE 1/2 WATT.

The I.F. transformers incorporated in this receiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

If a unit, such as the oscillator coil of IF transformer is to be removed, heat the mounting lugs with a pencil type soldering iron and move them away from the soldered connection with a long nose pliers or metal pick. Continue heating the lugs and brush away the molten solder with a small stiff glue brush. Remove the defective unit by lifting it off the chassis. Before inserting the new unit, be certain that the lug holes are open and free from solder. Forcing a lug against a solder filled lug hole may break the bond between the chassis base and the "printed" wiring. It is, therefore, necessary to exercise care when replacing units.

1/2 12AX7

In the event a chassis must be removed and speaker wires disconnected, it is imperative that when replacing the wires on the terminal board of the amplifier chassis that proper color coding be observed; brown wires must go to the terminals marked 'brown', black wires must go to the terminals marked 'black', and wires with the orange tracer on their edge must go to the terminals marked 'orange'. In addition to this, it is important that the wires connected to the terminals on the woofer speaker be replaced exactly as they are removed since to reverse one pair of parallel leads will cause these speakers to be out of phase with resulting poor tonal quality.

The schematic diagram illustrates a portable transistor radio circuit. The power source is a 117 V.A.C. plug connected to a 6AV6 tube socket. A switch labeled "SWITCH ON VOLUME CONTROL" is connected to the 6AV6 tube. The 6AV6 tube's grid is connected to a 100K resistor and a 2 MEG VOL. CONT. potentiometer. The plate of the 6AV6 tube is connected to a 22 MEG resistor and a 100 μmf capacitor. The 6AV6 tube's screen grid is connected to a 270 K resistor. The 6AV6 tube's control grid is connected to a 560 K resistor. The 6AV6 tube's cathode is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's heater is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's filament is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's base is connected to a 270 K resistor. The 6AV6 tube's plate is connected to a 270 K resistor. The 6AV6 tube's screen grid is connected to a 560 K resistor. The 6AV6 tube's control grid is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's cathode is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's heater is connected to a 50 Ω resistor and a 10% tolerance resistor. The 6AV6 tube's filament is connected to a 50 Ω resistor and a 10% tolerance resistor.

CHASSIS 7XT40 CIRCUIT #1

CHASSIS 7XT40 CIRCUIT #2

CHASSIS 7XT40Z

CHASSIS 7XT40Z1

MODEL "ROYAL 500" ALL TRANSISTOR RADIO

Material on Chassis 7XT40, Circuit #1, (Black code dot), is printed on page 184, in Volume 16, 1956 RADIO Diagram Manual. Service material on these receivers using the other circuits is printed below and on pages 187 through 189.

The "Royal 500" seven transistor portable has been produced with four basic chassis. This expedient was necessary to enable us to produce sufficient quantities by using transistors from many sources. All chassis have the chassis number stamped on them as well as a color identifying code on the battery compartment just above the battery installation instruction label. They are as follows:

Chassis 7XT40 - (Black) code dot
Chassis 7XT40 - (Maroon) code dot
Chassis 7XT40Z - (Red) code dot
Chassis 7XT40Z1 - (Green) code dot

The two 7XT40 chassis are very similar with the exception of the different coding on transistors. The transistors in these two chassis are manufactured by Sylvania.

The 7XT40Z uses transistors manufactured by Raytheon Mfg. Co.

The 7XT40Z1 uses transistors manufactured by Texas Instruments Inc.

In addition to this, each receiver has its individual transistor layout label and the color of the printing on these labels as well as the chassis number on these labels conforms respectively to the color dot and chassis number.

You will note that the initial 7XT40 circuit diagram illustrates an external earphone connection at the output of the driver transistor. This is also true of all the other chassis manufactured up to serial no. 33240. These chassis use an earphone part no. 39-20 which has an impedance of 2,000 ohms. Later on in receivers manufactured after serial number 33240, the earphone jack will be removed from the driver circuit and placed in the speaker voice coil circuit. A new earphone with an impedance of 15 ohms, part no. 39-22, will be required for this circuit.

ENGINEERING MODIFICATIONS

Since transistor circuitry is new and improvements are continually being discovered, Circuit 1 is for the original 7XT40 Chassis. The engineering staff has found ways to improve the AGC system as well as other portions of the circuitry. Therefore, the following engineering changes are design improvements on the original 7XT40 (See Circuit 2, 7XT40).

1. Originally the bias bleeder on the first IF stage was 100K and 15 K plus a 2 K volume control from B + to ground. The AGC by-pass of 3 mfd was at the junction of the 100 K and 15 K which meant that there was 15 K in series with the AGC current. During production the amount of AGC was found to be insufficient. The bias bleeder was then changed to 100 K, 4700, 4700 and 5 K volume control. The AGC by-pass of 16 mfd was put between the two 4700 ohm resistors.
2. 4700 and 47 K in junction with C15 and C16 were 2200 and 18 K respectively. This change was made to stabilize collector current of the driver transistor and slightly increase its gain.
3. In the event you do not wish to modify the circuit as in item 1, it is suggested that when servicing sets which exhibit AGC and overload problems, the bias bleeder of the first IF stage be changed. The original circuit had a 100 K and 15 K. These values should be changed to 47 K and 4700 ohms respectively. This in effect supplies more AGC voltage to the mixer and first IF.
4. You will note that C5 and C6 in the revised 7XT40 diagram have been terminated at ground and of course then the 470 ohm resistor from the 1st IF emitter must be by-passed with C23 a .05 condenser. C7 and C8 are terminated at ground for production convenience.

The 7XT40Z has not had any modifications up to the present time.

The 7XT40Z1 -

1. The 2200 ohm bias resistor in the 121-17 second IF transistor was 4700 ohms. It has been changed to 2200 ohms to reduce tweet, by slightly lowering gain.
2. 1 K resistor in the emitter of the 121-16 mixer was 470 ohms. This change was made to reduce tweet and noise.
3. On the patent & transistor layout label for 7XT40Z1 (Green Printing) the mixer transistor was marked 121-6. This was a typographical error and it should be 121-16.

ALIGNMENT PROCEDURE

Operation	Input Signal Frequency	Connect Inner Conductor From Oscillator To	Connect Outer Shield Conductor From Oscillator To	Set Dial At	Trimmers	Purpose
1	455 KC	ONE TURN LOOSELY COUPLED TO WAVEMAGNET	Chassis	600 KC	Adj. T1, T2, T3 for maximum output.	For I.F. Alignment
2	1620 KC		—	Gang wide open	C1C	Set oscillator to dial scale
3	1260 KC		—	1260 KC	C1A	Align loop antenna
4	535 KC		—	Gang closed	Adjust slug in T6	Set oscillator to dial scale
5	REPEAT STEPS 2, 3 AND 4
